BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**OPINION CONSTITUTING FINDINGS OF FACT, CONCLUSIONS OF LAW AND RECOMMENDATION**

Hearing was held on the Surface Water Coalition call, and the resulting Director's Orders, commencing January 18, 2008, and concluding February 5, 2008. At issue are the rights and obligations of the Idaho Ground Water Association (IGWA), members of the Surface Water Coalition (SWC), the City of Pocatello, and the United States Bureau of Reclamation (BOR). There is some repetition in the findings of fact and conclusions of law set forth in the various Director's orders and this recommendation. This results from an effort to make this recommendation coherent without repeating verbatim the orders entered by the Directors while defining the major facts, principles and conflicts at issue. This litigation is cast against a background of opposing parties that have high ground from which to plead their cases and either win or lose on positions because there must be decisions based on principles of law and determinations of fact, not because of questionable conduct.

The Surface Water Users have contributed immensely to the development of the State at great expense and risk. The financial commitments they have made to the development and operation of reclamation projects and the continuing improvement of delivery systems are immense. They have opened vast expanses of land to productivity and contributed significantly to the benefit of the State and local communities. They have done so under a state of law that

appeared to provide them with protection ("first in time, first in right") from interference with the rights they developed.

Ground water pumpers have invested significantly in the development of costly and beneficial enterprises under State approved policies. They accepted the challenge and the invitation to "make the desert bloom." They are not poachers who sneaked through an unlocked door to take water away from surface water users. They entered under State law in the open and have contributed significantly to the economic development of the State and local communities. In the case of the City of Pocatello it is a community of productive people who count on having water, the lifeblood of Idaho, available for its needs. Its policy makers must look to the welfare of its present residents and work to create a future of promise for those who follow.

The Bureau of Reclamation has partnered with Idaho to promote the State's welfare. It is unlikely that the farm economy of Idaho could have grown and developed without the enormous projects it manages. It has had to transform itself from limited roles to attempts to provide more things to more people who often compete to use the same water – irrigation, flood control, power, protection of fish, endangered species, flow augmentation of what appears to be a growing amount of demand upon the limited amount of water that falls from the sky and becomes subject to management.

The recommendations made in this decision are not based on a faulting party or a more worthy enterprise. All the participants are worthy, and in a perfect world with perfect weather all would win and proceed to do what they do best outside the legal arena.

I

HISTORICAL BACKGROUND

The current dispute arises between surface water users and ground water users. The surface water users draw natural flow water from the Snake River and from storage water held in reservoirs operated by the Bureau of Reclamation. The ground water users rely on water pumped from the Snake River Plain Aquifer. The surface water users hold water rights senior to the ground water users. The surface water users sought administration from the Director of the Department of Water Resources in the belief that their water rights were impinged upon by

ground water users. This case follows a series of decisions made by the Director in response to the request for administration.

1. The Eastern Snake River Aquifer. The Eastern Snake River Plain Aquifer (ESPA) is a source of water underlying the Eastern Snake River Plain that is approximately 170 miles long and 60 miles wide. The ESPA begins at the Teton Range near Ashton in the east and extends in a southwesterly direction following the Snake River downstream to King Hill. The ESPA comprises more than 10,800 square miles. There are estimates that it contains approximately one billion acre feet of water. The aquifer is made up primarily of fractured basalt, sometimes interspersed with river sediment or windblown material. It ranges in depth from thousands of feet to much more shallow levels. It forms a conduit for the flow of water, but that flow is neither consistent in pace nor direction. Unlike a river channel that can be observed and which flows along clearly defined lines and identifiable speeds and volumes, water in the aquifer may move as little as 0.1 feet per day to as much as 100,000 feet per day. The fractured basalt may form barriers that impede the flow of water and change its direction or may form conduits that channel the flow of water, allowing it to move quickly from one point to another. Since the movement is below ground, particular water cannot be traced from one precise point under ground to another precise point where it emerges to the surface.

2. The water in the aquifer and in the Snake River is connected. In the course of its travels water may be either ground water in the aquifer or surface water in the Snake River. It may enter or exit the river in identified locations on the river, referred to as reaches. A reach may either gain or lose water, depending on whether more water emerges from the aquifer or leaves the river to join water in the aquifer. Consequently, surface water irrigation practices and ground water pumping practices have interconnected effects on one another. That is the science that leads to this dispute.

3. The development of irrigation on the Eastern Snake River Plain. The initial development of irrigation in Idaho began in the second half of the 19th century when water was diverted from the Snake River and its tributaries and delivered to crops by channels on the ground – gravity or flood irrigation. There was no practical technology for significant movement of water from the aquifer to the surface for irrigation. Consequently, surface water use acquired

significant priority over subsequent ground water rights that developed when inexpensive electrical power allowed widespread withdrawal of water from the aquifer by pumping.

4. The Bureau of Reclamation manages a series of reservoirs that were developed to retain water for storage, flood control, and generation of electricity incidental to reservoir releases. The development of irrigation from the Snake River was accompanied by uncertainties in supplies and the potential for flooding while uncontrolled. Reservoirs were developed to capture water and retain it in storage for release at a later time when natural flow in the river is inadequate to meet irrigation needs. The legal title and beneficial use rights of the BOR and those who use the water in storage are set forth by the Idaho Supreme Court in *United States v. Pioneer Irrigation District,* 144 Idaho 116, 157 P.3d 610 (2007).

a. The BOR entered into contracts with irrigation districts for the provision of water held in storage until needed for irrigation. The reservoirs relevant to this dispute include Jackson Lake, Ririe Reservoir, Lake Walcott, American Falls Reservoir, and Palisades Reservoir. The BOR holds the following surface water rights as claimed in the SRBA for diversion of water from the Snake River for irrigation, reservoir storage for irrigation, and reservoir releases for irrigation and incidental power generation under some rights: Water Right No. 01-00284 which has been decreed with a priority date of March 30, 1921, for storage volume of 1.7 million acre feet in the American Falls Reservoir; Water Right No. 01-02064, licensed with a priority date of March 30, 1921, for 1.8 million acre feet in the American Falls Reservoir, and Water Right No. 01-02068, licensed with a priority date of June 28, 1939, for 1.4 million acre feet in Palisades Reservoir. Other rights claimed by the BOR are pending in the SRBA: 01-04052, 01-04055, 0104056, 01-04057, 01-10042, 01-10043, 01-10044, 01-10045, and 01-10053.

b. The BOR also has responsibility for some flows past Milner Dam. In addition to contract obligations to holders of storage rights the BOR has some responsibility for flows that pass Milner Dam, including mandated Federal Energy Commission bypass flows, Endangered Species Act needs and flow augmentation obligations that have been negotiated and agreed to as part of the Nez Perce settlement. BOR purchases flow augmentation water from the rental pool in which storage right holders may place water.

c. Management of the reservoir system allows water held under a storage right in one reservoir to be held in another. The various reservoirs are treated as part of a system. Water that is accounted for in one reservoir may be held in another. The reservoirs above Milner Dam fill by priority with consideration given to keeping the water stored as high in the system as possible when considering storage fill and release. Water stored high in the system can be run downstream when needed, whereas the reverse would be problematic.

5. Flood irrigation practices increased the amount of water in the aquifer through incidental recharge. Water that was not consumed by the crops or evaporation entered the ground and joined the water that was in the aquifer. As a consequence, the level of water in the aquifer rose above what the level would be absent the irrigation practices. This trend continued until the middle of the twentieth century at which time there were approximately 1.83 million acres under irrigation. At that time two developments occurred. In the 1950's Idaho Power had abundant inexpensive electrical power for which it needed a market in the summer. Idaho Power and the State of Idaho through its policy makers encouraged ground water development and the expansion of water use by pumping from the aquifer. This made practical irrigation of areas that were impractical for gravity flow irrigation from the river. It was, as the promotional literature of the day stated, the way to make the desert bloom. That is what happened. Over 50,000 ground water rights for agricultural and municipal use were developed, and vast quantities of water began to be withdrawn from the aquifer for those purposes.

6. The changes in irrigation practices. Coordinate with the development of ground water pumping was a change in irrigation practices by many surface water users who moved away from flooding the ground to use of sprinkler irrigation. Flooding or gravity irrigation often used more water than was necessary for crop growth. Additionally, gravity flow often meant crops at the beginning of the diversion received more water than crops further down the line and that it was impractical to deliver water to some property that could otherwise produce crops. A collateral effect of this change was a reduction of the incidental recharge to the aquifer that had occurred with flooding practices.

7. Consumptive use from ground water pumping has resulted in a net reduction in aquifer recharge ranging from approximately 1.6 to 3.0 million acre feet per year,

averaging in the area of 2 to 2.2 million acre feet per year. Large scale ground water pumping has contributed to a decline in ground water levels ranging between five and 60 feet throughout the ESPA. (Koreny Direct, p. 7).

8. The variability and unpredictability of weather creates risks which must be allocated between surface and ground water users. Long term weather forecasting has limited reliability, and the so-called average year is unusual, reflecting the average of high and low water years rather than a customary amount of precipitation that can be predicted with a high degree of certainty. The problem has accentuated over the past approximate twenty years when it appears that wet years are wetter and dry years drier. For example, 1997 was apparently an exceptionally wet year that created problems of managing more water than the reservoir system could accommodate. A period of years beginning in 2000 brought long term dry years which adversely affected the amount of natural flow water and the ability to fill reservoirs adequately to meet all needs. In 2007 the BOR made a judgment to release reservoir water based on the information it had. Unfortunately, the summer of 2007 turned into a historically hot and dry period, sometimes classified as a 200 year event. There was no way to recapture the water that was released, creating stress on natural flow and storage. Weather dictates water management to a large degree.

a. The reservoir system was developed to create a buffer against the uncertainty of weather. Water can be stored to be released when needed. If curtailment or replacement water is ordered to assure a greater amount of water in storage, ground water users are damaged, and there is the risk that the curtailed or replaced water will not be needed. If on the other hand curtailment or replacement by the ground water users is not ordered, the senior surface water users have the risk of running short of water or acquiring water through rental or lease, casting a significant risk and expense on them.

b. To date the system has not run out of water, and it appears there will be water available somewhere to meet irrigators' needs. During the last prolonged drought period there was water available somewhere at a price. Acquisition of that water may be very expensive and difficult, however. Conjunctive management means that risks must be allocated as to timing and expense, based on water forecasts which, using the best available science, may be wrong. At some point in the irrigation season it is clear

what the needs and the availability of water are, but that may come well into the season when everybody is scrambling to find a source for water and the price when found is high.

9. The need for conjunctive management of surface and ground water arose when it became apparent that the actions of one group had an effect upon the other. Ground water pumping increased, incidental recharge diminished, and additional water rights were licensed. No doubt many people understood the connection between the water on the surface in the Snake River and its tributaries and the water below the ground in the aquifer. Nonetheless, for a significant period of time the connection was ignored as the administration of surface water and ground water progressed independent of one another. Ultimately the connection was acknowledged and the need for conjunctive management became apparent. A series of drought years brought the problem to a head, and the Surface Water Coalition requested administration by the Director of the Idaho Department of Water Resources.

II

THE SURFACE WATER COALITION AND THE WATER RIGHTS OF ITS MEMBERS

1. The Surface Water Coalition consists of seven irrigation districts and canal companies below American Falls Reservoir that divert natural flow water from the Snake River and who hold storage water rights in various BOR reservoirs, providing irrigation water to nearly 700,000 acres. The SWC diverts reach gains emanating from the Eastern Snake Plain Aquifer (ESPA) and any tributaries below Blackfoot and reach gains and runoff that is not diverted by other upstream senior priority surface users that flows through Blackfoot into the American Falls reach. Water that would otherwise be natural flow that would pass the use of SWC members is captured to fill the SWC reservoir storage space in the Upper Snake Basin storage system for use when needed.

The members of SWC are the A & B Irrigation District (A & B), American Falls Reservoir District #2 (AFRD #2), Burley Irrigation District (BID), Milner Irrigation District (Milner), Minidoka Irrigation District (MID), North Side Canal Company (NSCC), and the Twin Falls Canal Company (TFCC). The members of the SWC share common interests in many

respects, but there are variations in the priority of their rights in both natural flow water and water from storage and the degree to which each is dependent upon either natural flow or storage. The natural flow rights of SWC accumulate to approximately 14,000 cubic feet per second (cfs) with priority dates ranging from 1900 to 1968, as recommended by the Director of the Department of Water Resources (IDWR). The members of SWC have storage contracts with the BOR for space in reservoirs which combine for approximately 2.3 million acre- feet (af) of water. The priority dates for the storage water rights range from 1906 to 1939.

2. The A & B Irrigation District. A & B holds natural flow right number 01-00014 for 267 cfs with a priority date of April 1, 1939, and storage water rights in American Falls Reservoir for 46,826 acre feet with a priority date of March 30, 1921, and 90,800 acre feet in Palisades Reservoir with a priority date of July 28, 1939, for combined storage rights of 137,626 acre feet.

3. The American Falls Reservoir District # 2. AFRD #2 holds natural flow right number 01-006 for 1,700 cfs with a priority date of March 30, 1921, and storage water rights in American Falls Reservoir for 393,550 with a priority date of March 30, 1921.

4. The Burley Irrigation District. BID holds natural flow right number 01-00211B for 655.88 cfs with a priority date of March 26, 1903, and natural flow right number 01-00214B for 380 cfs with a priority date of August 6, 1908, and natural flow right number 01-00008 for 163.4 cfs with a priority date of April 1, 1939. BID also has a storage rights in Lake Walcott for 31,892 acre feet with a priority date of December 14, 1909, 2,672 acre feet in Palisades Reservoir with a priority date of March 29, 1921, 155,395 acre feet in American Falls Reservoir with a priority date of March 30, 1921, 36,528 acre feet in Palisades Reservoir with a priority date of July 28, 1939, for combined storage rights of 226,487 acre feet.

5. The Milner Irrigation District. Milner holds natural flow right number 01-00017 for 135 cfs with a priority date of November 14, 1916, and natural flow right 01-00009 for 121 cfs with a priority date of April 1, 1939, and natural flow right number 01-02050 for 37 cfs with a priority date of July 11, 1968. Milner has storage rights of 44,951 acre feet in American Falls Reservoir with a priority date of March 30, 1921, and 45,640 acre feet in Palisades Reservoir with a priority date of July 28, 1939, for combined storage rights of 90,591 acre feet.

6. The Minidoka Irrigation District. MID holds natural flow rights number 01-00211A for 1,070 cfs with a priority date of March 26, 1903, right number 01-00214A for 620 cfs with a priority date of August 6, 1908, and right number 01-00008 for 266.6 acre feet with a priority date of April 1, 1939. MID has storage rights of 127,040 acre feet in Jackson Lake with a priority date of August 23, 1906, 58,990 acre feet in Jackson Lake with a priority date of August 18, 1910, 63,308 acre feet in Lake Walcott with a priority date of December 14, 1909, 5,328 acre feet in Palisades Reservoir with a priority date of March 29, 1921, 82,216 acre feet in American Falls Reservoir with a priority date of March 30, 1921, and 29,672, acre feet in Palisades Reservoir with a priority date of July 28, 1939, for combined storage rights of 336,554 acre feet.

7. The North Side Canal Company. NSCC holds natural flow rights 01-00210 for 400 cfs with a priority date of October 11, 1900, right number 01-00212 for 2,250 cfs with a priority date of October 7, 1905, right number 01-00213 for 890 cfs with a priority date of June 16, 1908, right number 01-00005 for 300 cfs with a priority date of December 23, 1915, and right number 01-00016 for 1,260 cfs with a priority date of August 6, 1920. NSCC has storage rights for 312,007 acre feet in Jackson Lake with a priority date of May 24, 1913, 9,248 acre feet in American Falls Reservoir with a priority date of March 29, 1921, 116,600 acre feet in Palisades Reservoir with a priority date of March 29, 1921, and 422,043 acre feet in American Falls Reservoir with a priority date of March 30, 1921.

8. The Twin Falls Canal Company. TFCC holds natural flow rights 01-00209 for 3,000 cfs with a priority date of October 11, 1900, right number 01-00004 for 600 cfs with a priority date of December 22, 1915, and right 01-00010 for 180 cfs with a priority date of April 1, 1939. TFCC has storage rights of 97,183 acre feet in Jackson Lake with a priority date of May 24, 1913, and 147,582 acre feet in American Falls Reservoir with a priority date of March 29, 1921, for combined storage rights of 244,765 acre feet. Twin Falls Canal Company has filed for irrigation to 196,162 acres, the amount IDWA has recommended. TFCC delivers water to 202,690 shares.

9. The members of SWC differ in their reliance on natural flow water and storage water.

a. MID, BID, A&B, AFRD #2 and Milner rely primarily on water from their storage contracts with the BOR. Their natural flow rights are relatively junior and commonly only provide water during the runoff period between April and June in years of moderate to good snowpack and runoff. When there is a low snowpack, such as the period from 2001 through 2004, the natural flow rights produce very little water. During the runoff period when there is water passing Blackfoot, these entities are able to divert natural flow water. When senior users upstream from Blackfoot divert the water that would otherwise pass Blackfoot, the senior natural flow rights of TFCC and NSCC command the inflow to the river downstream of Blackfoot, leaving little or no water for the natural flow rights of other canals in the Blackfoot to Milner reach.

b. NSCC has a natural flow right of 400 cfs with a priority date of 1900. This, along with TFCC which has a much larger natural flow right of the same date, commonly takes all of the natural flow downstream of Blackfoot. However, because of its limited amount of the natural flow right NSCC relies primarily on its extensive storage rights, cumulating to approximately 860,000 acre feet.

c. TFCC has a natural flow right of 3,000 cfs with a priority date of 1900. However, TFCC has a much smaller storage right, some 245,000 acre feet. While NSCC is primarily dependent upon its storage rights to meet its needs, TFCC is primarily dependent upon its natural flow rights to meet its needs.

10. The SWC members rely upon Snake River reach gains in the Near Blackfoot to Milner reach of the Snake River. There has been a declining trend in reach gains for the irrigation season. The SWC members attribute a substantial amount of the declines to ground water pumping and seek curtailment or an effective form of mitigation to remediate the condition they allege. If natural flow declines early in the irrigation season, there is a greater need to use storage water.

11. An undetermined number of individual irrigators within SWC may hold supplemental ground water rights which the former Director found to be minimal in effect. It would seem that any such ground water rights would be junior to the surface irrigation rights and subject to curtailment.

12. The Surface Water Coalition members may use water from both natural flow and storage with an accounting at the end of the irrigation season. The Coalition members divert what water they need as long as they have water available in storage. At the end of the year there is application of an accounting model to determine what portion of the water they consumed during the year was considered to be natural flow and what portion was considered to be storage. As long as the Coalition members have a positive number in their storage account they divert what they need during the season and there are not day to day adjustments or shutdowns by the watermasters. If they exceed their storage rights an accounting is done and reimbursement for the overage is required.

III

THE IDAHO GROUND WATER APPROPRIATORS, INC. AND THE WATER RIGHTS OF ITS MEMBERS

1. IGWA is a non-profit corporation incorporated in 1994 to protect and represent the interests of farmers, municipalities, businesses, and other users who depend upon ground water pumped from the Eastern Snake Plain Aquifer. Exhibit 4500 sets for a list of current members, and exhibit 4503 is a map reflecting the location of the ground water districts. Farmers and ranchers who are members of the districts irrigate in excess of 737,000 acres with more than 3,000 wells pumping from the ESPA. Their rights evolved from the late 1940's to 1992 when a moratorium was declared on the licensing of ground water pumping.

2. IGWA holds no storage rights in the reservoirs managed by the Bureau of Reclamation. Consequently at the present time there is no dedicated body of water IGWA can use for mitigation. It must contract with those holding rights to obtain replacement water in lieu of curtailment.

a. It would be very desirable to have a mechanism for IGWA to have an independent right to storage water which it could apply as replacement water as an alternative to curtailment and perhaps mitigate its own losses when the water is not necessary for replacement by selling the use for flow augmentation or other needs. Whether this is possible within the existing system is not clear. However, the example of the City of Pocatello holding a storage right for 50,000 acre-feet for water it cannot

access at the present time but which it can use for mitigation or sale may indicate this is an avenue that might be pursued if there is either uncontracted water held by BOR or the storage capacity of the system is expanded.

3. Nearly all ground water rights are junior to water rights held by the Surface Water Coalition. The extended development of ground water pumping began in the 1950's when Idaho Power had abundant electricity to market at low rates in the summer to operate the pumps necessary to lift water from the aquifer. Because of the late development of ground water pumping, nearly all of the ground water rights are junior to the water rights held by the Surface Water Coalition members.

4. Approximately 90% of the total steady state depletions due to ground water pumping have manifested themselves in the Snake River. Because of the erratic patterns of basalt with some other soil interspersed in the aquifer the rate of flow and route of water in the aquifer is different from surface water flow. There may be a significant period of time, extending to decades, from taking water from the aquifer to seeing the depletion in the Snake River.

5. The moratorium on ground water pumping in 1992 did not immediately result in what is described as a steady state condition, and dynamic equilibrium has not been fully attained. Steady state will be the point when the full effect of ground water pumping is realized and any declines in river flow may be attributed to something other than ground water pumping. That point has not yet been reached. This is the reverse side of the process whereby curtailment does not result immediately in increases to the Snake River flow equal to curtailment. The moratorium in 1992 has caused a leveling off of the effects of ground water pumping on the Snake River, but there are continuing depletions. As of the time the May 2, 2005, Order was entered there was approximately 10% more effect to be felt in the future from the ground water pumping that had already occurred. While 10% sounds small, when applied to an approximate average of two million acre- feet withdrawn annually from the aquifer, it means that somewhere in the area of 200,000 acre-feet of impact from ground water pumping is yet to be felt before steady state conditions are reached, a condition that will occur in increments that might take 100 years to complete.

6. For many years the Eastern Snake River Plain Aquifer was treated as a separate source from the Snake River and its tributaries with little regard for the effect that ground water pumping might have on surface water users. There may have been local concerns and concerns within the scientific community as to the long term effect of ground water pumping on the Snake River. But those concerns were not a part of State policy for many years as pumping flourished and the aquifer was treated as a vast reservoir unlimited in its capacity to supply water as long as it could be reached.

IV

THE CITY OF POCATELLO

The City of Pocatello is participating in this case based on concerns over its existing water supply and the possibility that new supplies it acquires may be junior to SWC's rights, and, consequently, subject to curtailment in the future. The City expects significant growth, as reflected in its Comprehensive Plan. The availability of a reliable water supply is critical to such growth.

The original water supply for Pocatello came from surface water diversions from Mink Creek and Gibson Jack Creek which are tributaries of the Portneuf River southwest of the City. These rights developed between 1869 and 1917 and are unrelated to the ESPA. The City also has a number of water rights that derive from the Lower Portneuf Valley Aquifer that date from 1905 (1924 according to the recommendation of IDWR) to 1992. The City's rights that derive from the ESPA date from 1939 to 1984, according to Exhibit 3005. Additionally Pocatello has a 50,000 acre-feet storage account in Palisades Reservoir on the Snake River. At the present time there a no means of diversion to deliver the storage water to Pocatello, but the stored water is available to be used as a mitigation alternative to curtailment or sale to others to meet replacement water requirements.

V

THE UNITED STATES BUREAU OF RECLAMATION

1. The United States Bureau of Reclamation operates the series of reservoirs that hold storage water for irrigation and has contracts with members of the Surface Water

Coalition and the City of Pocatello for water held in storage at the various reservoirs. The Bureau of Reclamation is a water resource agency that was created in 1902 to help settle the west by building irrigation projects so farming could develop. As part of the reservoir projects the Bureau of Reclamation entered into contracts with irrigation districts for the provision of water in storage. The reservoir facilities in the Upper Snake River region, starting at the upper end of the region, include Jackson Lake Dam which was built in the early 1900's with 847,000 acre-feet of active capacity. Palisdades Dam was built in 1956, with active storage capacity of about 1.2 million acre-feet. There is water that physically cannot be released and some inactive space for water referred to as the power head which is required to start a turbine. There is a dam at Island Park on Henry's Fork which holds about 135,000 acre-feet which was built in 1935 to provide supplemental water for the Fremont Madison Irrigation District. SWC has no interest in the Island Park Reservoir, except that water may be stored anywhere in the system. The same is true for a small reservoir called Grassy Lake Dam in Wyoming that also provides supplemental water to Fremont Madison Irrigation District. In 1976 the Corps of Engineers built Ririe Dam and Reservoir on Willow Creek, which is a tributary to the Snake River. Ririe was built primarily for flood control but has an irrigation component. Operation and maintenance of the Ririe facility was transferred to BOR in 1976. American Falls Dam and Reservoir was built in 1927 at the lower end of the system. It has 1.7 million acre-feet of active capacity and has a FERC licensed Idaho Power Plant. The last BOR reservoir on the system is Minidoka Dam or Lake Walcott which is a storage facility and diversion dam, plus a power plant. Though not a part of the BOR system, Milner Dam and Reservoir is important in that it is the point of diversion for water to Twin Falls Canal Company and North Side Canal Company.

2. There was a prolonged drought in the 1930's which demonstrated that the existing reservoir system was inadequate to meet irrigation needs in a long drought, leading eventually to the construction of Palisades to provide more storage. There is debate over whether the extended drought in the 1930's was less or more severe than the extended drought in the first half of this decade, sometimes described as a five hundred year event. Regardless, the reservoir system at that time was not adequate to meet the needs of irrigators in an extended drought period. The attempt to rectify that situation led to the construction of Palisades Dam and Reservoir, primarily as a storage facility for irrigation but combining multiple purposes including power and flood control which reduced the cost to irrigators. Part of the consideration for the

construction was irrigators entering into a winter water savings program whereby they gave up the practice of running natural flow water year round, not diverting for 150 consecutive days. In exchange for giving up the practice of running water in the winter to allow Palisades to fill they acquired priority rights to storage in the reservoir. A collateral effect of the winter savings program was a reduction of the incidental recharge to the aquifer.

3. There was an expectation when the reservoirs were built that they would fill approximately two-thirds of the time, and historically they have filled roughly two-thirds of the time. The significance of this relates to the questions of whether ground water pumping has defeated the expectations of storage in the reservoir system and whether the water that would accrue to the Snake River from the curtailment of ground water pumping would have anyplace to be stored in the reservoir system or whether it would flow in Snake River, potentially passing SWC members to go to another State.

a. The answer to the first question is that the reservoir system has not been defeated by ground water pumping, but it has been affected. It is desirable to fill the reservoirs, and they could be filled earlier and more often if there were curtailment. This result would assist BOR in its compound functions. The relevant function in this case is the ability to deliver water to irrigation space holders in the amounts contracted.

b. The answer to the second question is that there is capacity in the reservoir system to accommodate the influx of additional water from curtailment in a number of years. Secondary to this result is that natural flow rights would be supplied longer and allow storage water to be held longer. There are years in which water going into the Snake River as a result of ground water curtailment would pass the reservoir system and go beyond Milner Dam, potentially benefitting others who are not parties to this proceeding, including Idaho Power, those concerned with the Endangered Species Act, the Nez Perce settlement and any other flow augmentation interests, and the State of Oregon. It is not the purpose of this litigation to meet those other interests. The purpose is to define the legal rights and obligations of the parties to this proceeding and how those rights are consistent with or contrary to State policy. Collateral consequences to other interests are for another forum.

4. Space holder contracts are agreements between BOR and Irrigation Districts whereby the Districts have the right to storage space for water in the reservoirs which they may use when there is water in the space.

5. The irrigation districts are obligated for repayment of construction costs and costs of operation and maintenance of the reservoir system. The reservoir system was not a gift from the federal government to Idaho. The irrigation districts that have rights to water in the reservoirs have obligations for repayment of construction costs and for contributions to operation and maintenance of the system.

6. In addition to the storage of water for irrigation the BOR has responsibility for flood control, some production of electrical power incident to the release of water from storage, the management of water to meet requirements of the Federal Energy Commission, the Endangered Species Act and the Nez Perce Settlement. Life was simpler when the primary purpose of reclamation projects was to open the West to development so men and women with strong minds and backs could raise healthy crops and children. The reservoir system had this development as its principle purpose. There is now a need to parse water among many competing interests. Below Jackson Lake there is concern for a cutthroat trout fishery. Below American Falls and Walcott Idaho there are four species of snails that are protected under the Endangered Species Act. There are energy needs and settlement rights. The Nez Perce Agreement between the United States, the State, and the Nez Perce in which irrigation districts participated established flow augmentation rights dependent upon water conditions, defined by the so-called Rainbow Chart. The total flow augmentation due, if available, is 487,000 acre feet, 60,000 of which is attributable to the Nez Perce Agreement. Of the 487,000 acre feet, 185,000 comes from the Upper Snake Reservoir system. To fulfill its obligations under the Nez Perce Agreement, BOR sometimes leases water from different water banks, including the upper Snake which encompasses SWC members. Sometimes water is available from the rental pool, when there has been a good water year. Other times flow augmentation is not available from the rental pool, such as 2007 when the parameters of the rainbow chart associated with the Nez Perce Agreement were not met.

Beyond these obligations there is a need to manage the system to avoid flooding, which at times is inconsistent with holding water for irrigation.

7. The Bureau of Reclamation is a proper party to these proceedings. The nature of the relationship between the BOR and the irrigation districts with which it has contracts is described in *United States v. Pioneer Irrigation District,* 144 Idaho 106, 157 P. 3d 610 (2007). Additionally, it has interests that can be impacted by decisions concerning the allocation of water. Whether a party or not the BOR has responsibilities and practices which are essential to understand to evaluate the claims of the competing water users. The same evidence would have been needed even if BOR had not remained in the case

VI

CREATION AND OPERATION OF WATER DISTRICTS

1. On November 19, 2001, the State of Idaho sought authorization from the Snake River Basin Adjudication (SRBA) District Court for the interim administration of water rights by the Director in all parts of the Department's Administrative Basins 35 and 41 overlying the ESPA in the American Falls area and all or parts of Basins 36 and 43 overlying the ESPA in the Thousand Springs area. The District Court granted the motion on January 8, 2002, finding that the water supply in basins 35, 36, 41, and 43 was not adequate at that time and was projected to be inadequate at times in the future to satisfy all water rights, concluding that interim administration in accordance with the Director's reports and partial decrees was "reasonably necessary to protect senior water rights in accordance with the prior appropriation doctrine as established by Idaho law." After notice and hearing, the Director issued two orders on February 19, 2002, creating Water District No. 120 and Water District No. 130 pursuant to the provisions of Idaho Code section 43-604. Subsequently the boundaries of Water District 120 and 130 have been expanded and the Director has issued orders creating additional water districts, including 100, 110 and 140.

2. The Water Districts were created to provide for the administration of water rights to protect prior surface and ground water rights. Watermasters in Districts 120 and 130, acting under the direction and supervision of the Director have the duties to curtail illegal diversions, measure and report the diversions under water rights, enforce the provisions of any

stipulated agreement, and curtail out-of-priority diversions which the Director determined to be causing injury to senior surface and ground water rights, unless the out-of-priority diversions were covered by a stipulated agreement or mitigation plan approved by the Director.

VII

THE CALLS AND THE DIRECTOR'S ORDERS

1. On January 14, 2005, the Surface Water Coalition delivered a letter to the Director of the Idaho Department of Water Resources headed "Request for Water Right Administration in Water District 120 (portion of the Eastern Snake Plain Aquifer)/ Request for Delivery of Water to Senior Surface Water Rights." The letter noted that there were "negotiations with groundwater users to find a long term agreement that will restore their water supplies and stabilize the declining spring flows and aquifer levels." However, the letter requested conjunctive administration of water rights, asserting that both natural flow and storage water rights have been reduced by depletions to the aquifer caused by junior ground water pumping which has caused material injury to the Surface Water Coalition: "Curtailment of junior ground water rights must therefore occur over a period of time unless substantial aquifer recovery occurs as a result of artificial or natural recharge in excess of the present rate of groundwater depletions."

2. An order for the administration of water rights was issued by the former Director on May 2, 2005. In response to the request for administration the former Director entered an Order February 14, 2005, requesting information from each member of the Coalition, including water diversion data, irrigated acreage, and crop data for the irrigation seasons from 1990 through 2004. Thereafter the former Director entered an Amended Order dated May 2, 2005, which superseded an April 19, 2005, Order. The Order predicted material injury to SWC members in 2005 of 133,400 acre-feet, consisting of shortages, plus carryover shortfalls. The Order established a 27,700 acre-feet replacement water obligation on IGWA, predicting that to be the material injury to the Surface Water Coalition. This figure was adjusted down to 27,006 acre-feet in the third supplemental order dated June 29, 2006, after a final accounting of the water determined to be due in 2005, resulting in the mitigation water for 2005 being supplied in

2006. There was no new obligation for replacement water in 2006 because the reservoirs filled. The May 2, 2005 Amended Order, together with subsequent orders, is at issue in this proceeding.

3. The May 2, 2005 Order outlined the procedural background, the applicable science, the water rights of the parties, and made findings of fact and conclusions of law determining among other things:

a. Junior water pumping caused material injury to senior surface water irrigators affecting natural flow and storage rights.

b. IGWA was directed to provide replacement water or face curtailment.

c. The Order utilized a "minimum full supply" standard in predicting material injury, applying the amount of water SWC members used in 1995 as the anticipated minimum amount they should have available in 2005 to meet crop needs, subject to adjustment.

d. The Order utilized the unregulated flow at the Heise Gage to predict the water supply.

e. The effects of curtailment from different dates were simulated using the Eastern Snake Aquifer Model.

f. The Order predicted material injury to members of SWC and concluded that there must either be curtailment or replacement water provided by IGWA.

4. The Supplemental Order Amending Replacement Water Requirements dated July 22, 2005, followed the protocol outlined in the May 2, 2005 Order by monitoring weather conditions affecting the water supply and making additional findings. The Director recapitulated the process outlined in the May 2, 2005, Order as follows:

For each member of the Surface Water Coalition, the Director (1) averaged the 2002 and 2004 natural flow diversions; (2) estimated the 2005 storage allocation based on the average of the volume of water stored after April 1, 2002, and after April 1, 2004, added to the water actually in storage on April 1, 2005, less estimated 2005 evaporation; and (3) summed the average natural flow diversions and estimated 2005 storage allocations. The sum of natural flow diversions averaged for 2002 and 2004 and the estimated 2005 storage allocations based on the

actual storage as of April 1, 2005, and the storage after April 1, averaged for 2002 and 2004 was deemed the predicted 2005 water supply for each Surface Water Coalition member.

The 2005 water supply was subtracted from the water supply in 1995 which had been determined to reflect a "minimum full supply." If the difference was greater than zero the difference was the "Predicted Shortage in 2005." The Director noted that there were changes in water supplies available for the remainder of 2005 from those predicted, finding that there was higher precipitation and lower temperatures than anticipated and that the unregulated flow at the Heise Gage was between the levels of 2002 and 2004. The Director revised findings in the prior Order to reflect that "only American Falls Reservoir District #2 has any remaining reasonably likely predicted shortages in 2005 (13,200 acre-feet)." Further, "The predicted shortage in the water supply available in 2005 to the American Falls Reservoir District #2 is 13,200 acre-feet, and the predicted material injuries to the American Falls Reservoir District #2 and the Twin Falls Canal Company are 64,400 acre-feet and 5,400 acre feet respectively." However, the Supplemental Order did not reduce the minimum amount of replacement water (27,700 acre-feet) provided by IGWA. This replacement water was to be allocated by the Director "among the members of the Surface Water Coalition to offset actual shortages in the water supplies available to the individual members of the Coalition, as necessary, or to offset shortages in carry-over storage held by individual members of the Coalition at the end of 2005, as determined by the Director to be reasonably needed."

5. The Second Supplemental Order Amending Replacement Water Requirements was entered December 27, 2005, in response to IGWA's Petition for Reconsideration of July 22, Supplemental Order and Twin Falls Canal Company's Request for End of Year Accounting. The Second Supplemental Order reflected that only the Minidoka Irrigation District exceeded the assigned minimum full supply, and the Order modified the minimum full supply for the Burley and Minidoka Irrigation Districts. The Director observed that the use of less than the minimum full supply by the other districts could either indicate that the districts did not need that much water or they conserved out of concerns for future shortages. The Director determined that only the Twin Falls Canal Company had shortages and suffered material injury. This was based on findings that the unprecedented precipitation in May and June which benefited storage had less beneficial impact on TFCC because of its relatively small amount of storage, relying primarily on natural flow. The reach gains providing its natural flow rights

between Near Blackfoot and Neeley Gage "declined dramatically beginning in about the second week of July, recovering in August to levels similar to those observed in August of prior years...."

In Finding 22 the Director set forth the results of simulated curtailment scenarios of junior priority ground water rights, summarizing the result of full curtailment: "Curtailing all ground water diversions in Water Districts No. 120 and No. 130 for one year would, over time, increase reach gains in the Snake River between the Near Blackfoot Gage and the Minidoka Gage by a total amount of 621,300 acre-feet, which is more than four times the material injury preliminarily determined to have occurred in 2005 to the water rights held by or for the benefit of the Surface Water Coalition members." Other scenarios reflecting the results of curtailment of ground water pumping were outlined. Curtailment back to July 23, 1977, was utilized in determining the amount of replacement water due. The Order found that there were only incremental increases in reach gains resulting from the lease and non-use of water rights held by FMC Idaho, LLC, the non-irrigation of leased lands, and mitigation actions implemented in Water District No. 130. The Order set forth the actions necessary by IGWA to avoid curtailment.

6. On June 29, 2006, the Director entered the Third Supplemental Order Amending Replacement Water Requirements Final, 2005 & Estimated 2006. The Order reviewed the history of actions by the parties and the Department, including entry of an Order Staying proceedings and Amended Scheduling Order on February 10, 2006, staying proceedings for 60 days. The Director concluded that only Twin Falls Canal Company suffered material injury in 2005. The remainder of the replacement water that IGWA was to supply in 2005 was to be supplied to the Twin Falls Canal Company at the beginning of the irrigation season rather than as reservoir carryover storage in 2005 in the event the reservoir storage space held by the Twin Falls Canal Company would fill in 2006 with the additional carryover of 27,006 acre-feet. The Director concluded that while "there is no reasonably likely material injury to any member of the Surface Water Coalition predicted during the 2006 season, the Director should continue to monitor water supply and climatic conditions in 2006 and require additional replacement water or curtailment in the event material injury occurs." The Director predicted material injury based on a regression analysis of the years 1990 through 2005, estimating the material injury to be one standard deviation below the best-fit trendlines. This is a difficult analysis to grasp for the non-

scientist, but apparently the effect is to conservatively estimate the natural flow that would be available to members of the Surface Water Coalition, causing an increase in the computed amount of predicted shortfall.

7. On July 17, 2006, the Director entered a Fourth Supplemental Order on Replacement Water Requirements for 2005. This Order recounts a complex trail of steps to determine the amount of replacement water provided, finding among other things that the replacement water credited to IGWA improperly excluded a credit of 1,133 acre-feet from a lease by IGWA of ground water used by TFCC that was held and not used by FMC Idaho. Further steps were outlined for compliance with replacement requirements.

8. On May 23, 2007, the Director entered the Fifth Supplemental Order Amending Replacement Water Requirements Final 2006 & Estimated 2007. The Director determined that none of the SWC members had shortages or material injury, except the appearance of a 39,916 acre-foot shortage for the Twin Falls Canal Company. However, since TFCC diverted 80,078 acre-feet less than its minimum full supply of 1,075,900 and carried over 40,162 acre-feet more than its reasonable carryover storage supply of 38,400 acre-feet, the Director determined that it was not materially injured in 2006.

Finding 22 provided that "If crop evapotranspiration is greater in 2007, or precipitation during the irrigation season is less than in 1995, the amounts of water diverted in 1995 may be less than what is needed for a full supply in 2007. If crop evapotranspiration is less in 2007, or precipitation during the irrigation season is greater than in 1995, the amounts of water diverted in 1995 may be more than what is needed for a full supply in 2007." Twin Falls Canal Company was the only member of the Surface Water Coalition predicted to have a material injury during the 2007 irrigation season – 58,914 acre-feet. The Order concluded that IGWA would be able to acquire sufficient storage water to mitigate for material injury to TFCC and that, "The calculated water debt resulting from Twin Falls Canal Company's irrigation season diversions will be replaced by the Ground Water Districts during or **at the end of the irrigation season from storage water procured by the Ground Water Districts which will be credited to the storage water account of Twin Falls Canal Company."** (emphasis added). However, the Order also provided that "The replacement water will be delivered to Twin Falls Canal Company as it is

needed during the irrigation season...," quoting from IGWA's 2007 Replacement Water Plan. Conclusion of Law 4. That was not done.

The Order concluded that involuntary curtailment should not be required to meet the obligation and provided that, "Mitigation debits and credits resulting from year-to-year mitigation will continue to accrue and carry forward until such time as the storage space held by the members of the Surface Water Coalition under contract with the USBR fills. At that time, any remaining debits and credits will cancel." Conclusion of Law 5.

9. The Sixth Supplemental Order Amending Replacement Water Requirements and Order Approving IGWA's 2007 Replacement Water Plan entered July 11, 2007, approved IGWA's Amended Joint Replacement Water Plan (exhibit 4502A) for 2007, giving the ground water districts the option of providing water to meet the mitigation plan or, if the water was not available, to pay Twin Falls Canal Company at the rental pool rate. The Sixth Supplemental Order approved IGWA's replacement water plan in which IGWA would underwrite or guarantee Twin Falls Canal Company had a full minimum supply of 1,075,000 acre-feet. Other matters of consequence developed in the process.

a. Flood control releases were greater than anticipated. Consequently, the earlier expectation that the reservoir would fill did not occur, resulting in 264,546.9 acre-feet of storage less than expected.

b. By July 8, 2007, only Twin Falls Canal Company and North Side Canal Company were diverting from natural flow. All other SWC members were dependent upon their storage water.

c. The Director properly departed from the earlier practice of utilizing only the Heise Gage to predict natural flow for the irrigation season. Up until this Order the Director had used data collected at the Heise Gage in the early season to provide information with which to make predictions as to natural flow supplies for the irrigation season. However, the Director concluded in Finding 11 that, "In order to predict natural flow supplies for TFCC for the remainder of the irrigation season, it is no longer appropriate to use data from the Heise Gage, as virtually all reach gains to the Snake River that are available to TFCC are a result of return flows and not flow into the system

from springtime runoff." This change was appropriate, since the Heise Gage would provide no useful information at that stage of the irrigation season. The Heise Gage is a sufficiently reliable predictor of spring runoff to utilize early in the process, but once weather conditions and the state of storage are known the process should be expanded to incorporate whatever sources will provide the most current information.

d. The Order provided that the Director would make a final determination of the amounts of mitigation required and actually provided after the final accounting for surface water diversions for 2007 was complete. The Order provided:

"To the extent less mitigation is provided than was actually required, a mitigation obligation will carry forward to 2008 and be added to any new mitigation determined to be required for 2008. To the extent more mitigation is provided than was actually required, a mitigation credit will carry forward to 2008 and be subtracted from any new mitigation determined to be required for 2008."

10. The Seventh Supplemental Order entered December 20, 2007, determined that Twin Falls Canal Company used less than the minimum full supply established in the May 2, 2005 Order, resulting in a reduction of the replacement water required to 17,345 acre feet. This adjustment required IGWA to acquire 14,345 acre feet of the water it was short to transfer to the Director for the use of Twin Falls Canal Company. A final accounting was to take place in 2008. The transfer from the Director to the Twin Falls Canal Company was completed during the course of this hearing. Following the pattern from 2005, rather than the water being provided in the year it was determined to be due, it was provided in the subsequent year. Issues presented by the Seventh Supplemental Order are addressed separately in this recommendation.

11. The former Director properly included Water District 130 in the orders for administration. The Surface Water Coalition did not request administration in District 130. However, the former Director determined ground water depletions in Water District 130, as well as District 120, were impacting members of the Surface Water Coalition and that the Coalition could not selectively seek administration. Consequently, District 130 was included in the orders that have been entered.

12. Unless modified explicitly or by necessity from the recommendations in this opinion, the findings and conclusions of the Director's in the various Orders are accepted.

VIII

THE EFFECT OF THE AMOUNT LICENSED OR DECREED AND THE BURDENS OF PROOF

1. There is a presumption that a senior water user is entitled to the amount of water set forth in a license or decree. *American Falls Reservoir District No. 2 v. Idaho Department of Water Resources,* 143 Idaho 862, 878, 154 P. 3d 433, 449 (2007), addressed the threshold burden in a water adjudication in discussing the Conjunctive Management Rules when there is a decree. The logic applies to the rights claimed in this case unless they are subsequently altered by decree in the Snake River Basin Adjudication.

> The Rules should not be read as containing a burden-shifting provision to make the petitioner re-prove or re-adjudicate the right which he already has. We note that in the Initial Order entered in this case, the Director requested extensive information from American Falls for the prior fifteen irrigation seasons, to which American Falls objected in part. While there is no question that some information is relevant and necessary to the Director's determination of how best to respond to a delivery call, the burden is not on a senior water rights holder to reprove an adjudicated right. The presumption under Idaho law is that the senior is entitled to his decree water right, but there certainly may be some post-adjudication facts which are relevant to the determination of how much water is actually needed. The Rules may not be applied in such a way as to force the senior to demonstrate an entitlement to the water in the first place; that is presumed by the filing of a petition containing information about the decreed right.

2. The senior water right holder must allege material injury under oath setting for the basis of that belief.

The Rules require the petitioner, that is the senior water rights holder, to file a petition alleging that by reason of diversion of water by junior priority ground water rights holders, the petition is suffering material injury. That is consistent with the statutory provision which requires a surface priority water right holder claiming injury by junior water right holders pumping from an aquifer to file a "written statement under oath" setting forth "the facts upon which [he] founds his belief that the use of his right is being adversely affected" by the pumping. I. C. sec. 42-237b. The Rules further provide that the petitioner file a description of his water rights, including the decree, license, permit or claim for such right, the water diversion and delivery system he is using and the beneficial use being made. The Rules then provide three additional types of information which must be provided by the petition; however, the Rules are clear in saying that the additional information should be provided only *if available* to the petitioner.

Id. 878.

SWC made the threshold showing that is required.

3. The licensed or decreed amount of a water right is a maximum amount to which the right holder is entitled. The right holder is presumed entitled to that amount, and the burden is upon a junior right holder to show a defense to a call for the amount of water licensed or decreed. *AFRD #2, at 878,879.*

4. "Once the initial determination is made that material injury is occurring or will occur, the junior then bears the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call." *AFRD #2, at 879.*

5. The Surface Water Coalition made the showing that its members had licensed or decreed water rights and that material injury was occurring. There was evidence submitted indicating that ground water reduces reach gains upon which SWC members are dependent and that there have been crop losses resulting from water shortages.

6. The process utilized in this case deviated from that anticipated by the Supreme Court. The former Director did not have the benefit of *AFRD #2* when SWC made its request for administration in this case. The Court anticipated that once the initial showing of material injury was made by a senior water user the burden would shift to the junior ground water users to show a defense to the senior's call. In this case the former Director explained his thinking, responding to questions concerning the use of 1995 to establish a base number for a minimum full supply:

> Q. Was the year 1995 cast in stone, Mr. Dreher?
>
> A. No. It was a starting point. It – under this whole conflict that had developed, my view was that it was the State's responsibility – the department's responsibility to initially take the burden of determining the extent of injury and the appropriate recourse. Some might say, well, that burden should be put on the juniors. They ought to have to prove the negative. They ought to come in and prove that they're not causing injury.
>
> Well, the reason I disagree with that is because it's the State that authorized those junior-priority diversions. It's the State that issued the licenses. And the junior rightholders, even though they're junior and even though they are subject to all prior rights, their rights are real too. They had just been decreed in the SRBA, and I didn't think it was appropriate to say, okay, prove that you're not causing any injury; we – the State has

issued these water rights, we've issued these decrees, now you prove that you're not causing injury. I didn't think that was the appropriate way to do this.

Similarly, it certainly was inappropriate to, at least in my view, put the burden on the seniors. Okay. You allege you're being injured. Now, prove it. I didn't think that was appropriate.

And so in developing this May 2nd Order, I tried to develop a process under which the State would take the initial burden of making these determinations, and then there would be a hearing – I didn't anticipate that I wouldn't be the hearing officer, but I did anticipate that there would be a hearing – under which the factual issues and the legal issues were resolved.

And during that hearing process either side of this, either the ground water side or the surface water side, could have and probably would have brought forward information about why 1995 was or wasn't a good year to use for the minimum full supply. Again, not the amount that was needed for 2005, but what would be the minimum amount that would be needed. And certainly, in that process I would have been open to considering other methodologies, other criteria. But I thought it was important that the State take the first step to try to bring some resolution to this. The idea was that doing it this way might bring the two sides closer together. I guess it didn't work.

Tr. Vol. I, pp. 50-52.

7. The methodology adopted by the former Director makes sense and is consistent with the construction of the Conjunctive Management Rules but does not acknowledge the burdens anticipated by the Supreme Court in AFRD #2 which was decided after the May 2, 2005, Order. The senior surface water users have the initial burden of establishing their water rights and material injury to those rights. After the senior has made that initial showing, the burden shifts to the junior right holders to show a defense to the senior's call. The methodology applied by the former Director is consistent with the structure of the Conjunctive Management Rules. In applying that methodology the Supreme Court anticipated that the Director would approach the resolution of the call applying the presumption favoring the senior right holder, once the threshold showing of material injury has been met by the senior right holder. It is not clear that the Director applied the burdens. Those burdens remain in this proceeding.

8. The Director has the authority and the responsibility to investigate claims when a call is made that may result in curtailment. Whether the Director approached the case applying the legal burdens established in AFRD #2 or not, the Director had the authority and the responsibility to develop the facts upon which a well-informed decision could be made and to

make a decision from the best information developed. To do otherwise would be irresponsible to the public interest and often unduly expensive to the parties.

9. IGWA and Pocatello have the burden of establishing defenses to SWC's claims.

10. The parties may rely on facts developed by the Director and in the absence of more persuasive contrary evidence the Director's findings are accepted.

IX

MATERIAL INJURY

1. CM Rule 10.14 defines material injury, as "Hindrance to or impact upon the exercise of a water right caused by the use water by another person as determined in accordance with Idaho Law, as set forth in Rule 42." CM Rule 10.14. CM Rule 42 provides:

DETERMINING MATERIAL INJURY AND REASONABLENESS OF WATER DIVERSIONS (RULE 42).

Factors. Factors the Director may consider in determining whether the holders of water rights are suffering material injury and using water efficiently and without waste include, but are not limited to, the following:

a. The amount of water available in the source from which the water right is diverted.

b. The effort or expense of the holder of the water right to divert water from the source.

c. Whether the exercise of junior-priority ground water rights individually or collectively affects the quantity and timing of when water is available to, and the cost of exercising, a senior-priority surface or ground water right. This may include the seasonal as well as the multi-year and cumulative impacts of all ground water withdrawals from the area having a common ground water supply.

d. If for irrigation, the rate of diversion compared to the acreage of land served, the annual volume of water diverted, the system diversion and conveyance efficiency, and the method of irrigation water application.

e. The amount of water being diverted and used compared to the water rights.

f. The existence of water measuring and recording devices.

g. The extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices; provided, however, **the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years. In determining a reasonable amount of carry-over storage water, the Director shall consider the average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system.** (emphasis added).

h. The extent to which the requirements of the senior-priority surface water right could be met using alternate reasonable means of diversion or alternate points of diversion, including the construction of wells or the use of existing wells to divert and use water from the area having a common ground water supply under the petitioner's surface water right priority.

2. A hindrance to reasonable carry-over storage constitutes material injury. The argument has been made that storage is not a beneficial use of water. The logic of this position is that beneficial use is the measure of a water right, and until there is insufficient water to serve crop needs there is no impingement on beneficial use and no material injury to a water right. The logic has sense to it, but fails. CM Rule 10.14 is broad enough to encompass a storage right, and CM Rule 42.01.g. sets forth the right to carryover storage in enumerating factors that may be considered in determining if there is material injury. Storage water is held to meet crop needs as requirements arise, and that right is protected.

3. Ground water pumping has hindered SWC members in the use of their water rights by diverting water that would otherwise go to fulfill natural flow or storage rights. Once it is established that the Snake River and the Eastern Snake Plain Aquifer are connected the conclusion is inevitable that withdrawal of water from the aquifer reduces flow in the Snake River. At any given time there is a finite amount of water. If it goes one place and is consumed in the growing of crops, it cannot go to another. That does not mean that all water withdrawn from pumping has an adverse effect on surface water users dependent upon the Snake River. Sometimes there is enough water entering the system to fill all needs. In such circumstances conjunctive management is unnecessary or minimal. Times of shortage call the CM Rules into play. The evidence in this case establishes that during recent periods of water shortage ground water pumping has affected the quantity and timing of water available to SWC members. Natural flow rights have been exhausted earlier and storage has been used earlier and more

extensively, limiting the application of water during the irrigation season and diminishing the amount of carryover storage to which the surface water users are entitled.

4. The members of the Surface Water Coalition suffered material injury from ground water pumping in 2004, and it was reasonable to predict material injury in 2005. In determining predicted material injury for 2005 the former Director observed in Finding 109 that none of the members of SWC had "identified lands that are entitled to receive surface water but have not been irrigated or where crops could not be harvested because of shortages in surface water supplies available to members of the Coalition under the members' various rights. The Coalition simply alleges that material injury is occurring because in recent years members of the Coalition have been unable to divert natural flow at the diversion rates authorized under the members' rights for as long a period of time as the members otherwise could, but for depletions caused by diversions of ground water under junior priority rights." However, IDWR staff contacted University of Idaho Agricultural Extension Agents and U.S. Department of Agriculture Farm Service County Directors in Lincoln, Gooding, Jerome, and Twin Falls counties and determined that there were estimated losses of 35% because of shortages in surface water supplies, though not primarily the result of shortages from the Snake River. Findings 110, 111. Reports indicated that "North Side Canal Company has carefully managed water diverted to minimize waste, shareholders have reduced nozzle sizes on sprinkler systems, and that estimated losses in crop production because of shortages in surface water supplies were about 5 percent in 2004." Finding 112. The FSA Director reported a ten day shut off at the end of May in 2004 for corn growers served by American Falls Reservoir District #2 that had substantial impact on some growers, stressing crops, but yields were near normal. However, the fourth cutting of hay was foregone so that available water could be used to finish corn crops. Estimated crop production losses were to be 15% in 2004. Id. In Jerome County the FSA Director reported that shortages caused only slight declines in crop production. Finding 113. Lands served by the Twin Falls Canal Company had some loss in crop production, the last cutting of hay reduced, and corn crops reduced, though largely because of delayed harvest, not water shortages. Finding 114. What this all adds up to is that water shortages adversely impacted crops and influenced crop decisions, e.g. foregoing a cutting of hay to supply water to corn crops.

5. After the senior-water users show a licensed or adjudicated right and a hindrance to that right, the factors set forth in CM Rule 42.01 are in the nature of defenses to the claim of material injury. At some point a determination has been made that a licensed or adjudicated water right holder has an entitlement in priority to a certain amount of water if that water can be applied to a beneficial use. That right is not absolute. Nature may change the course of a river. Water may not be available through no cause related to junior users. However, to the extent water is available within the amount of the water right but is diminished by junior users, the presumption favors the senior users' rights to the water. That right may be limited or lost by consideration of the factors in 42.01.

X

THE ESPA MODEL AND ITS APPLICATION

1. Conjunctive management of surface and ground water required the development of a model to understand the interaction of the two. Conjunctive management of surface and ground water rights depends upon an understanding of the hydrology of surface and ground water and the relationship between the two. Unlike the history of surface water administration in which a watermaster could monitor water he or she could see and understand the immediate effect of curtailment, the relationship between surface water and ground water rights is much more complex. The same water may be surface water at one point and ground water at another. When it is surface water it may be tracked with some certainty as to amount, direction, and speed or flow. When it is ground water its course is hidden. Water that enters the aquifer at the eastern end may take a century to exit at the western end. There have been numerous studies of the geology of the aquifer and ground water resources of the Eastern Snake River Plain dating from 1902 (Russell). See S. P. Garabedian, *Hydrology and Digital Simulation of the Regional Aquifer System, Eastern Snake River Plain, Idaho.* Pp. 10, 11. None of the studies provided an adequate basis for actual administration of water rights between ground and surface water. Consequently, IDWR contracted with the University of Idaho Water Resources Institute to develop a new and enhanced model. The model was developed with broad based representation, including a substantial number of the witnesses who testified for competing interests in this litigation and the prior Thousand Springs case. The model was calibrated to a 22 year data set from 1980 through 2002. The model divides the Eastern Snake River Plain into square mile cells which are

assumed to be homogenous in their composition. It is described as "a numerical ground-water model of the Eastern Snake River Plain which is calibrated to a sufficient time period to represent a wide range of aquifer stresses."

2. The ESPAM was used to determine a curtailment date that would supply the amount of water in the Near Blackfoot to Minidoka reach that the former Director had determined to be material injury. After the Director made a determination of the amount of material injury to the surface water users caused by ground water pumping, the ESPAM was used to determine the priority date for curtailment that would remediate the material injury.

3. There are two versions of the ESPAM, Version 1.0 and Version 1.1. Version 1.0 was the initial model and was used in formulation of the May 2, 2005, Order. Subsequently, it was discovered that there were some calibration errors in the model and it was revised to correct those errors. The errors were the result of including water that spilled from the end of a ditch and returned to the river. This showed up in the river as gains for accounting purposes, but it did not represent an interaction between the river and the aquifer. According to Dr. Wylie who performed the model runs, the results between the two models would have been in the area of 435 acre feet one way or the other. This is a small amount in considering the volume of water to be replaced. The former Director began using the Version 1.1 as soon as it became available.

4. There are limitations in the use of the model. The aquifer is not uniform in its geology. It is composed of fractured basalt that may lie in random patterns, sometimes interspersed with soil of a different composition. There may be variations within the model cells, contrary to the assumption of homogeneity. Hydrologists describe a cone that is created when water is pumped. Water from connected areas then flows to the cone. The assumption for model purposes is that the cone is uniform, but it may not be, since the aquifer is not uniform in structure. The scientists know these things and developed the model to account for them.

5. The model cannot predict the effect of a particular well on a particular spring. Conclusions must be drawn on a regional basis. Withdrawal of water from wells in certain cells will have an effect on spring flows within a particular reach or reaches, not that a particular well will have a certain effect upon a particular spring in a reach. The closer the well is to a spring source the more likely there is to be an immediate effect.

6. The model is calibrated with a six month stress period; consequently, there is a greater degree of uncertainty in attempting to reflect reach gains in a period of time less than six months. Less water is needed in the spring when weather is cooler, soil retention of water higher, and precipitation more likely than in the summer when temperatures rise and precipitation usually drops. These patterns occur within less than the six month calibration period. Ideally the changes in reach gains from curtailment could be focused more precisely as to timing so there would be an understanding of whether curtailment delivered water when most needed. That, however, is not the state of science at this time.

7. The former Director utilized a 10% margin of error that is appropriate until a more scientifically based margin is established. Development of a more scientifically, peer reviewed, margin should be a priority. Development of the model has not proceeded to the point of establishing a margin of error. Those involved in the development of the model agree that it is not 100% accurate and that it is desirable to determine an error factor. The calls that have been made have necessitated decisions before the next stage in model development. The former Director recognized that there had to be a margin of error in the application of the model and assigned a 10% error factor. This conclusion was based on the fact that the gauges used in water measurement have a plus or minus error factor of 10%. The former Director concluded that the model could be no better than the measuring gauges used and used the 10% margin absent a better figure developed through further testing of the model. No party offered credible evidence of a better margin of error.

8. The former Director used the 10% margin of error as a trim line, excluding ground water users from curtailment who were in that margin. The purpose of the trim line or clip was to avoid curtailing ground water users who might have no effect on enhancing reach gains. Application of the trim line was proper to avoid a significant probability that curtailment would extend to ground water users who would suffer significantly without contributing water where necessary to remediate the material injury to the surface water users.

9. It was appropriate to use the ESPAM in making the conjunctive management decisions in this case. The ESPAM versions used by the former Director were the best science available. Decisions had to be made and will have to be made. The limitations of the model are

identifiable and important, but they do not preclude reliance upon it. It has an acceptable level of reliability based on peer reviewed science.

10. As improvements are made that lead to a more reliable model those results should be utilized. Doubtless the science of the relationship between the Snake River and the aquifer has not been exhausted. If study and application of the model leads to refinements or revelations, those improvements should be applied as they occur.

XI

THE SYSTEM OF WATER STORAGE

1. The rental pool is a pool of water, primarily among other storage users, which may be used as a means to move storage water from one entity within the water district to another entity without subjecting that storage space to forfeiture. There are rental pool procedures that set forth the manner in which the rental pool is to be operated. The procedures are within the authority of the Water Resource Board that designates what is called the Committee of Nine in Water District 1 as the elected representatives of interests within the district. The Committee of Nine is in charge of the local rental pool. The watermaster is the manager of the rental pool. If an entity holding a storage right with water in the rental pool rents water to another entity an accounting is done deducting the amount rented from the storage right holder's account and transferring it to the entity renting the water.

a. The primary purpose of the rental pool is to provide additional irrigation water to space holders within the water district. Only after the primary purpose has been satisfied is additional water available for use by non-space holders.

b. When a final accounting is done for the water year the amount that a lessee has rented is the first water deducted from the lessee's account. The water that one entity rents from another entity is treated as the first storage water used by the entity receiving the water. If the entity that leases the water from another does not use it during the irrigation season, that entity runs the risk of losing the water unless it has storage space to hold it.

c. If an entity overdraws its storage account it is billed for the excess storage used or has to make rentals or private leases to make up for the excess.

2. According to Rental Pool Procedures Rule 2.25 for Water District 1, useable reservoir system capacity for the reservoirs delivering water to the Water District 1 area was been determined to be 4,172,708 acre feet.

3. There is a hierarchy for the rental of water from the rental pool in times of scarcity.

4. The price for water in the rental pool varies on a supply-demand basis, beginning at $5.00 per acre-foot, plus 10% to the Water Resource Board, plus 80 cents administrative fee, for a cost per acre foot of $6.80, going up to $18.00 per acre-foot, plus 10%, plus 80 cents, for a total of $20.60 per acre-foot.

5. Private leases are another form of obtaining water from a space holder. A private lease is a private agreement between a willing buyer and a willing seller that the water district is not involved in except to account for where the water comes from and where it goes. The water district charges an administrative fee for the accounting but does not set the rate that is negotiated. For purposes of refilling in subsequent years the space that has been used for a private lease becomes the most junior space in the reservoir system.

6. Flow augmentation is water released to the river from storage to meet Endangered Species Act concerns and the requirements of the Nez Perce Settlement Agreement. Flow augmentation benefits salmon, steelhead, snails, and whatever other creatures are dependent upon water and are protected.

7. The Director of the Department of Water Resources does not hold space in the reservoirs, but the Director does have the authority under Title 42, Chapter 6, to supervise the distribution of water. The Director instituted a system of assignment whereby IGWA acquires the required replacement water by private lease and then transfers the water to the Director to then direct it to the entity entitled to receive it. This has created conceptual difficulties because the Director has no storage space, and the system of accounting for water requires that the water be assigned to a storage account. If the Director has not assigned or

allocated the water by the final accounting in late February or March the water reverts back to the lessor. The conceptual difficulty should not defeat the practical result of getting water from IGWA to the entity that is entitled to it.

a. In the absence of a mechanism for the Director to hold storage space, the water should be accounted for in the storage holder's account subject to IGWA's contractual right, which is in turn subject to the Director's right to order distribution of the water to the proper entity, at which time it is accounted for in that entity's account. If the assignment has not been completed by the final accounting, the water should remain in the lessor's storage account, subject to the Director's right to direct assignment of the water, provided there is space available in the lessor's account. The problem arises if the lessor's storage space fills with water not impounded by the Director in which case there apparently is no existing system to allocate the water to any account. This is an accounting problem, not one of science. It should be solved by amendment of the accounting system or, if necessary by legislation establishing a system. Regardless of the method utilized, once a replacement water plan has been approved the water should be available to the entity entitled to use it. This can be accomplished by a direct transfer from the account of the spaceholder supplying the water to the account of the entity entitled to receive it. If there is a need to have an assignment to the Director, it is not apparent. This has become a flashpoint of unnecessary controversy, evident in the recent hearing when IGWA had obtained the right to water to be transferred to the Twin Falls Canal Company but TFCC did not see the water in its account. When the Director approves a replacement water plan, that plan should identify where the replacement water will go and set a time frame. When IGWA contracts for the replacement water there seems to be no reason to pass the water through the Director. His directions for transfer are sufficient.

XII

THE ROLE OF PUBLIC INTEREST IN CONSIDERING CURTAILMENT

1. The public interest is a proper interest to be considered in responding to a request for the administration of water rights. The concept of "first in time, first in right" is a

fundamental principle in Idaho water law. Idaho Code section 42-106 provides, "As between appropriators, the first in time is first in right." Case law has enforced this rule for generations. However, this principle is not without limitation. In *American Falls Reservoir District No. 2 v. Idaho Department of Water Resources,* 143 Idaho 862, 878, 154 P. 3d 433, 449 (2007), the Supreme Court cited *Schodde v. Twin Falls Land and Water Co.* 224 U.S. 107, 32 S. Ct. 470, 56 L. Ed. 686 (1912), noting that "evaluation of whether a diversion is reasonable in the administrative context should not be deemed a re-adjudication." In *Schodde* the U. S. Supreme Court was interpreting Idaho law. The Idaho Supreme Court would not be bound by the interpretation, but the Idaho Court has cited it favorably, and the Legislature has had nearly one hundred years to address issues presented by *Schodde* and act otherwise. It has not done so. The facts of *Schodde* have limited application to this case but the case reflects that the public interest is a factor to be considered in water rights litigation that impacts the public.

Article XV, Section 5 of the Idaho Constitution acknowledges the priority in time of water rights but passed to the Legislature the authority to subject that priority to "such reasonable limitations as to the quantity of water used and times of use as the legislature, having due regard both to such priority of right and the necessities of those subsequent in time of settlement or improvement, may by law prescribe." The Legislature responded in Idaho Code section 42-106: "As between appropriators, the first in time is first in right." This provision must be read in the context of Idaho Code section 42-101:

> Water being essential to the industrial prosperity of the state, and all agricultural development throughout the greater portion of the state depending upon its just apportionment to, and economical use by, those making a beneficial application of the same, its control shall be in the state, which, in providing for its use shall equally guard all the various interests involved. All the waters of the state, when flowing in their natural channels, including the waters of all natural springs and lakes within the boundaries of the state are declared to be the property of the state, whose duty it shall be to supervise their appropriation and allotment to those diverting the same therefrom for any beneficial purpose is recognized and confirmed; and the right to the use of any of the public waters which have heretofore been or may hereafter be allotted or beneficially applied, shall not be considered as being a property right in itself, but such right shall become the complement of, or one of the appurtenances of, the land or other thing which, through necessity, said water is being applied; and the right to continue the use of any such water shall never be denied or prevented from any cause than the failure on the part of the user thereof to pay the ordinary charges or assessments which may be made to cover the expenses for delivery of such water.

Idaho Code section 42-602 vests supervision of the distribution and control of water in the Director of the Department of Water Resources, this authority to be accomplished by watermasters. Section 42-602 provides that, "The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine." This provision raises the question of whether the Director may consider the public interest in making a determination that there should or should not be curtailment or other mitigation or is to look solely at the timing of the water right and the amount stated in the license or decree. It is clear that the Legislature did not intend to grant the Director broad powers to do whatever the Director might think right. However, it is clear also that the Legislature did not intend to sum up water law in a single sentence of the Director's authority. The appropriation must be for "some useful or beneficial purpose." Idaho Code section 42-104. A water user cannot waste water. These principles remain. Similarly, the constrictions of Idaho Code section 42-101 that water is the property of the state "which, in providing for its use shall equally guard all the various interests involved."

AFRD #2 recognized a presumption that the senior water right holder is entitled to the licensed or decreed water right. However, "Once the initial determination is made that material injury is occurring or will occur, the junior then bears the burden of proving that the call would be futile or to challenge in some constitutionally permissible way, the senior's call." The Rules for Conjunctive Management of Surface and Ground Water Resources (CM Rules), Rule 20.01, acknowledge the prior appropriation doctrine: "These rules acknowledge all elements of the prior appropriation doctrine as established by Idaho law." However, Rule 20.03 acknowledges other elements:

> **Reasonable Use of Surface and Ground Water.** These rules integrate the administration and use of surface and ground water in a manner consistent with the traditional policy of reasonable use of both surface and ground water. The policy of reasonable use includes the concepts of priority in time and superiority in right being subject to conditions of reasonable use as the legislature may by law prescribe as provided in Article XV, Section 5, Idaho Constitution, optimum development of water resources in the public interest prescribed in Article XV, Section 7, Idaho Constitution, and full economic development as defined by Idaho law. An appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water as described in this rule.

In *AFRD #2* the Supreme Court determined that the Conjunctive Management Rules are not facially unconstitutional. Rule 20.03 is at the heart of the rules and how they will be applied. Had any Rule been subject to a facial challenge, 20.03 was one. It was adopted October 7, 1994, and has remained untouched by the Legislature or the Supreme Court. It incorporates the law as it has developed. "First in time, first in right" is fundamental to water administration whether considering surface to surface or conjunctive management of ground water and surface water, but the principle is subject to consideration of the public interest. The Director is not limited to counting the number of acre-feet in a storage account and the number of cubic feet per second in the license or decree and comparing the priority date to other priority dates and then ordering curtailment to achieve whatever result that action will obtain regardless of actual need for the water and the consequences to the State, its communities and citizens. Application of the water to a beneficial use must be present, not simply a desire to use the maximum right in the license or decree because that simplifies management of the water right.

These conclusions have significance in considering several issues in this case. They affect the Director's use of the so-called "trim line," a point of departure beyond which curtailment will not be considered. It affects the Director's consideration of alternatives to curtailment. The public interest affects determination of whether there will be curtailment or other mitigation to provide for carryover storage water, drawing a line between what is reasonable and what is hording. It affects consideration of issues of farm efficiency as opposed to achievable farm efficiency. Consideration of the public interest gives relevance to evidence of the economic impact of curtailment upon the State and local communities.

XIII

USE OF THE MINIMUM FULL SUPPLY ANALYSIS

1. The concept of a minimum full supply addresses issues in Conjunctive Management Rule 42 concerning (a) material injury and (b) the reasonableness of SWC member water diversions. Rule 42 sets forth factors the Director may consider in determining material injury and the reasonableness of diversions, but the rule does not set forth an analytical framework for application of those and other factors that may be relevant. The former Director

was called upon to develop a protocol in uncharted administration. Central to the process utilized by the former Director is the concept of a minimum full supply.

2. As developed in the May 2, 2005 Order a minimum full supply is an attempt to predict the minimum amount of water the surface water users need to meet their crop requirements, below which curtailment is necessary if the minimum is not met as a consequence of junior ground water depletions. The minimum full supply as initially determined was to be subject to change according to conditions. According to the former Director, the sum of shortages to the minimum full supply and to reasonable carryover constituted the material injury entitling the members of the Surface Water Coalition to curtailment or other remediation. Tr. Vol. I p. 97. The former Director described the minimum full supply as a base amount, not fixed, that could be adjusted during the year as weather conditions, cropping decisions, and the availability of water could be determined more precisely. A final accounting of need would be made as the year developed when all factors of need could be seen.

3. The amount determined to be a minimum full supply affects the determination of whether there is material injury from ground water pumping and the extent of mitigation if there is material injury. If the minimum full supply is set high, the likelihood of finding material injury resulting from ground water pumping is greater. If the minimum full supply is set at a lower level the likelihood of finding material injury decreases, because in theory the needs of the surface water irrigators are satisfied with the lesser amount.

4. The minimum full supply is not linked to the licensed or decreed water right or to the storage space to which an irrigator is entitled. The licensed or decreed right and the amount of storage for which there is a contract with BOR set maximums. If an irrigator needed more water than those rights, the irrigator could not obtain curtailment of junior water rights. The irrigator would have to obtain water at his or her own expense. The minimum full supply is intended to establish the amount necessary to meet water needs independent of the licensed, decreed or contracted rights.

5. Application of the concept of a minimum full supply has been difficult to understand. Unfortunately, a problem in this case is reflected in a comment made by the former

Director in response to a question by counsel for IGWA concerning carryover storage: "Well, apparently I've made this process so confusing that now you're confusing me." Tr., Vol. II, p. 340. Part of this hearing objective is to clarify the process applied and identify how that either fits or conflicts with established law.

The process followed by the former Director is best described in answer to questions propounded on behalf of BOR:

> Q. So the first thing you did when you did your analysis is you reviewed the licenses or decrees to determine what amount of water constituted the maximum full supply of the calling entity's natural flow; is that correct?
>
> A. Well, the maximum amount of water that they were entitled to divert. It didn't have to do with the supply. But you're right, the first thing I did was looked at the licenses and decrees to determine what the maximum amounts that could be diverted or diverted to storage in the case of the Bureau of Reclamation.
>
> Q. Okay. The second thing is you utilized the forecasted runoff of flows at Heise as of April 1st; is that correct?
>
> A. Correct.
>
> Q. Third, from that forecast you projected the natural flow and storage for each calling and surface entity?
>
> A. Projected the natural flow anticipated to be available and the storage anticipated to be available for each of the entities that were making a call; yes.
>
> Q. Fourth, you determined the need of the surface water users by looking at 15 years of deliveries from 1990 to 2004 and determined that 1995 was a year that represented the minimum full supply for each of the entities?
>
> A. 1995 was the most recent year, except for the Twin Falls Canal Company, when a full supply was delivered. And it became the floor of what represented the minimum full supply that would be needed.
>
> Q. And so the 1995 deliveries were the deliveries you thought the calling entity should receive of both natural flow of storage subject to possibly changing climatic conditions during the irrigation season?
>
> A. Correct.
>
> Q. And that was for their minimum full supply?
>
> A. Correct.
>
> Tr. Vol. II, pp. 302-304.

The former Director projected the carryover the surface entities should have for 2006 by taking the water deliveries for 2002 and 2004 and averaging the two together, assuming that the natural flow available in the storage accruals in 2006 were the same as the average of those two years.

The former Director looked to the year 1995 to determine a measure for a minimum full supply. At trial the following colloquy took place:

> Q. But you used the year 1995, did you not? Because that was the year in that 15 year period of record that used the least water to deliver five-eighths and three-quarters of an inch at the headgate?
>
> A. That's correct.
>
> Vol. I, Tr. pp. 147, 148.

The concept was that, "You know, what I think I said in my deposition is that I went through determination of how much was needed on an annual basis to make sure that we were, on the one hand, providing the minimum supply on an annual basis that would be needed, providing a means to adjust that for climatic variations in the growing season and at the same time providing for maximum utilization of the resource." Vol. I, Tr. p. 148. The former Director gave further explanation of the concept of a minimum fully supply:

> The – we started with what we termed the minimum full supply, which was based upon the amount needed in 1995. And the intent was then to make adjustments – that was the floor. The intent was to make adjustment either above or potentially below, but more likely above, if the climatic conditions varied substantially from what was substantially overall the – the irrigation season from what occurred in 1995. Tr., Vol. II, p.282.

To finish the process the former Director took the projected natural flow and the projected storage that would be available in 2005. He added those amounts together to develop the predicted 2005 supply in Finding 116. He then subtracted the predicted 2005 supply from the minimum full supply needed to determine whether there would be overall shortages or surpluses. The conclusion was that there would be shortages that would result in material injury. The former Director then used the ESPA Model and the boundaries of the water districts and the ground water districts to allocate how much of the shortage was attributable to each water district and each ground water district.

5. The practicalities of hydrology justify a departure in ground water administration from surface to surface water administration in the interest of irrigators and the public. In surface to surface water administration the watermasters are able to observe the conditions of crops and know the immediate effect of curtailing a junior surface water user to deliver water to another surface water user. Curtailment may be partial or complete for a brief period during which the junior user's crop may survive until curtailment ends. In ground water to surface water administration there is not the immediacy of response in the delivery of water to a senior user. Curtailment of the ground water users may well not put water into the field of the senior surface water user in time to remediate the damage caused by a shortage, whereas the curtailment is devastating to the ground water user and damaging to the public interest which benefits from a prosperous farm economy. Consequently, the former Director sought to determine the likelihood of shortages in advance in order to takes steps to have the ground water users prepared to provide timely replacement water in the season of need to avoid curtailment. The ground water users do not have storage water rights. Consequently, the aim was to have a decision in place to alert them as to the amount of water they would need to secure by contract to supply replacement water in the irrigation season and avoid curtailment. The concept of a minimum full supply was a step in this process to predict the likelihood of a shortage and the amount and allocation of replacement water in the event of shortage.

6. Use of the process of establishing a minimum full supply departs from the practice of recognizing a call at the level of the licenses or decrees, understanding that if less water is needed less will be delivered. The history of surface to surface water administration has been that if a senior water user made a call within the licensed or decreed right the watermaster shut down delivery of water to a junior water user if necessary to deliver the licensed or decreed amount to the senior. Historically the senior user gets the licensed or decreed amount of water without analyzing a minimum full supply and through that process limiting delivery of the water. SWC maintains the same process should be applicable in the ground water to surface water management. The logic of SWC in objecting to the Director's use of a minimum full supply is difficult to avoid. The irrigation districts have water rights at a certain level. The senior users are presumed to have the full extent of their rights if they can apply the water to the beneficial use for which it was appropriated. If a portion of the water is not available as a result of junior ground water pumping, there should be curtailment of the

junior rights in the absence of a mitigation agreement. Starting with this protocol the ground water users would know at the beginning of the water season that they would have to stand ready to provide mitigation up to the full extent of SWC's rights or face curtailment when a shortage attributable to them occurred. The surface water users would have maximum protection to their rights. The detriment is that the ground water users might well incur the expense of leasing water that is not needed. If they did not have lease agreements in place the acquisition of water might be exceptionally expensive or they might not be able to obtain replacement water and be curtailed. That would ruin them for the season and possibly fail to get water to the surface users in time of need. Additionally, it would not eliminate mid-season disputes when the surface water users claim they need every acre-foot of their rights and the ground water users maintain that there is no such need so the water would not be applied to a beneficial use.

7. Use of the minimum full supply analysis starts at a different point from recognizing the right of a senior right holder to receive the full amount of the licensed or decreed right, attempting to make an advance judgment of need. Inherent in the application of the minimum full supply is the assumption that, if it accurately defines need, use of water above that amount would not be applied to a beneficial use and would constitute waste. This strains against the assumption that the senior users are entitled to the full extent of their rights licensed or decreed rights which at some point has been determined to be an amount they could beneficially use. The hedge built into the concept of a minimum full supply as initially outlined in the May 2, 2005 Order is that the minimum full supply is a base that can be raised if more is needed to satisfy crop and storage requirements. Inherent in the prospect of using a baseline approach in ground water to surface water use is the possibility that it might translate back to the surface to surface administration and change the historical practice.

8. The attempt to project the amount of water that is necessary for the members of SWC to fully meet crop needs within the licensed or decreed amounts is an acceptable approach to conjunctive management, but there have been applications of the concept of a minimum full supply that should be modified if the use of the protocol is to be retained. Whether one starts at the full amount of the licensed or decreed right and works down when the full amount is not needed or starts at a base and works up according to need, the end result should be the same. However, there should be adjustments if the process of establishing a base

different from the licensed amount is to be utilized in future administration. These might well have been addressed but for the interruption of the process by challenges to the validity of the Conjunctive Management Rules and the consequent uncertainty in the process.

a. 1995 was a wetter than average year, diminishing the validity of use of that year to establish the base for a minimum full supply and underestimating the material injury likely to occur in 2005 and subsequent years. According to the Snake River Heise Natural Flow information from 1911-2004 (exhibit 1000) 1995 was in the top third of wet years. Overall it was a wetter than average year. This warps the determination of a base supply downward. If precipitation saturates the soil and relieves the need for the use of irrigation either from natural flow or storage the amount necessary from natural flow and storage declines. Basing the minimum full supply on a wet year makes it likely that material injury was underestimated in 2005 and subsequent years, unless an adjustment is made at the outset to account for the effects of a greater than average amount of precipitation through the year.

b. The process adopted in the Director's minimum full supply has been objected to as focusing on supply in establishing the base rather than the amount of water that is necessary to fully satisfy the irrigator's needs under the water rights. The fact that the 1995 water year provided full headgate deliveries does not by itself tell whether all that water was applied to a beneficial use or whether there was more water than could be applied to a beneficial use.

c. Use of the protocol of a minimum full supply is not an avenue to modify licensed or decreed rights. A challenge to the validity of a licensed or decreed amount of water must come through another avenue than application of the minimum full supply. The use of the concept of a minimum full supply tempts administration that requires the senior surface water users to alter their practices or show why they have not while permitting the junior users to continue pumping the full amount of their rights out of priority.

d. When conditions changed in 2007 the minimum full supply was not adjusted. The year 2007 created a vexing problem. The snowpack runoff that occurred

in April, May, and June was below the long term average for the district, resulting in less natural flow in the river. This led to a greater demand on storage water. The summer turned into a hot, dry period for humans, beasts, and particularly crops. The increased temperature and lower precipitation also led to greater demand on storage water. 2007 was either the first or second highest storage use year since Palisades Reservoir was built according to Lyle Swank, the watermaster for District 1. It was the type of situation envisioned in establishing the minimum full supply that would call for adjustments. However, as appealing as the concept of flexibility is, implementation is more difficult than the principle. Procedures for adjustment were not in place. Steve Burrell, who is responsible for monitoring river flows, diversion data, and maintaining a database of diversions and river flows throughout the state, testified that the minimum full supply became a hard and fast number, absent explicit instructions on how to adjust the baseline:

Q. Okay. So you were using the 1995 minimum full supply baseline as a hard-and-fast number?

A . That is – yes. We were using the same methodology as was used in the May 2005 order.

****

Q. So I guess at this point in time it's your position – or I shouldn't say yours – the Department's position that no matter what, the baseline for 1995 applied? That was the minimum full supply, period; correct?

A. Correct.

Tr., Vol. II, pp. 648, 649.

e. There must be adjustments as conditions develop if any baseline supply concept is to be used. The reality of the risk in use of the minimum full supply appeared in the Seventh Supplemental Order illustrated by the treatment of American Falls Reservoir District which was entitled to reasonable carryover of 51,200 acre-feet but had only 3,495 acre-feet to carry over. It would appear that they were injured by the shortage in the amount of 47,705 acre-feet. However, this amount was discounted and adjusted downward because American Falls Reservoir District diverted water in excess of the

minimum full supply – the diversion was 433,414 acre-feet whereas the minimum full supply defined from use of the year 1995 was 405,600 acre-feet. Steve Burrell was questioned on this point:

> Q. So it's now the director's position that if any entity diverts more than their minimum full supply, it will count against the reasonable carryover that they're entitled to have at the end of the year for purposes of a call?
>
> A. I guess, yes, in the absence of any information or any instructions on how to proceed with modifying the minimum full supply, that is the approach being taken.
>
> Tr., Vol. II, p. 669.

The same process was applied to North Side Canal Company. The Director had determined that North Side had reasonable carryover of 83,300 acre-feet. It had only 61,004 acre-feet to carry over. Instead of finding that North Side had injury of 22,296 acre-feet, the Director determined that it had no injury. This process of reducing the injury to carryover storage was unique to 2007, based upon the observation that some members of the Surface Water Coalition used only their full minimum supply or less. Consequently, the conclusion was reached that those who exceeded the full minimum supply may not have needed it which precluded mitigation or replacement water to cover the excess used. This conclusion was based on looking at the Surface Water Coalition as a whole and the total diversions in relation to 1995.

American Falls and North Side both used water within their water rights, not in excess of their licensed or adjudicated rights. The record does not show if there were or were not special circumstances that distinguished American Falls and North Side from the other members of the Surface Water Coalition, nor does there appear to be evidence showing the water was not applied to a beneficial use. The fact that other members of SWC lived within their minimum full supplies is evidence tending to show that American Falls and North Side could have done so, but it is not conclusive. The others may have conserved in fear of a follow up year as bad as 2007, or they may have managed better. There does not appear to have been an examination of the irrigation practices of the entities that exceeded the minimum fully supply and no finding that the entities were wasting water. According to Steve Burrell the approach of treating the minimum full supply as a fixed amount was employed because of a lack of explicit instructions on how to evaluate the minimum full supply in the prior orders. Tr., Vol. II, p.674. The process utilized

runs contrary to the presumptive right of a senior water user noted in *AFRD # 2* and contrary to the expectations under which the water users were operating since the May 2, 2005, Order.

f. Affidavits that had been submitted by the canal company managers should have been considered. Affidavits were submitted by canal company managers in June concerning water needs and demands for 2007. Those affidavits should have been considered, along with an opportunity for IGWA to respond.

g. Using the minimum full supply as a fixed amount in effect readjudicates a water right outside the processes of the SRBA. Treating the minimum full supply as a cap reducing the right to mitigation in carryover storage has profound consequences. In practical effect it adjudicates a new amount of the water right outside the SRBA without a determination of specific factors warranting a reduction. Additionally, predictability is a strong value in water administration. The 1995 minimum full supply established in the May 2, 2005, Order as a minimum base that could be moved up if conditions warranted was treated as a maximum carrying adverse consequences if exceeded. Logic would indicate that a supply adequate in a wet year would not be adequate in an extremely hot and dry year. Using the minimum supply as the fixed supply departs from the original concept. As long as the minimum full supply was subject to adjustment as conditions changed, it was only a starting point and had limited significance even though based on a questionable year. When treated as a fixed amount in 2007 it had great significance beyond its intended purpose.

XIV

THE DEVELOPMENT OF AN AVERAGE YEARLY IRRIGATION SUPPLY FOR SURFACE WATER COALITION MEMBERS

1. The licensed or decreed amount of a water right is a maximum which if used to establish yearly need would often over predict material injury. Using the maximum amount in determining a level of water that will be needed would in instances be higher than the amount necessary. Although it could be adjusted down, it would require commitments to be made for the acquisition of water that at times would not be needed. It would not encourage reasonable conservation as required in CM Rule 42.01.

2. Predictions of need should be based on an average year of need, subject to adjustment up or down depending upon the particular water conditions for the irrigation season. This is the initial concept behind the minimum full supply. The development of an acceptable baseline subject to adjustment for changing conditions retains the value of having senior rights while providing some level of protection against unnecessary curtailment. The concept is good, but the minimum full supply identified by the Director has no defenders from the parties. A brief summary of objections to the Director's minimum full supply can be stated:

a. It is based on a wet year. To get to an average moisture year an adjustment would be necessary to determine how much greater the minimum full supply would be if the weather equated to an average year when an adequate amount of water was delivered.

b. It is based on a decade old year that does not reflect current efficiencies such as the increased use of sprinkler irrigation and computer monitoring or changes in the amount of land irrigated.

c. It has an emphasis on supply rather than need. That is the amount of water that provided full headgate deliveries. Those may or may not have been needed in that wet year.

3. The parties have attempted to establish water budgets that reflect the needs of SWC members using sophisticated analytical techniques, but the parties' analyses are too far apart to reconcile. There are scientific approaches well beyond what water was taken and used that the parties have utilized in order to establish the amount of water SWC members actually need to meet full crop years over time. They have considered soil composition using different approaches, the losses in conveyance, evaporation, and crop needs. It is enlightening science. The irony in this case is that surface water and ground water expert testimony used much of the same information and in some respects the same approaches and came up with a difference of 869,000 acre-feet for an average diversion budget analysis of SWC districts for the period from 1990 through 2006. Sullivan Rebuttal Report, November 7, 2007, page 17. The total under the SWC analysis is 3,274,948 acre-feet as compared to the Pocatello analysis of the ground water users' analysis of 2,405,861. The Director's minimum full supply amount of 3,105,000 falls between the two, though much closer to the SWC analysis. The process does not

promote much faith in the science of water budget analysis. From the mass of material submitted in this case conclusions must be drawn, and while one might expect the "Who's Who" of experts testifying to lead the lay person to an area of reconcilable conclusion, that has not occurred.

The ground water users' analysis differs dramatically from the SWC calculations and the Director's minimum fully supply in the conclusions concerning North Side Canal Company and Twin Falls Canal Company. For North Side there is a 473,217 acre-foot difference between the SWC analysis and the ground water users' analysis and a 354,558 acre-foot difference with the Director's minimum full supply. Evidence submitted concerning North Side's terrain and length of system make it highly unlikely that North Side could raise crops to full maturity with the number of cuttings otherwise possible with the smaller amount of water calculated by the ground water users. Only unusual weather conditions would provide enough water. The same is true for Twin Falls Canal Company where the difference is in excess of 310,000 acre-feet. Subtracting that much water from irrigation in a year would not meet crop needs utilizing the systems and practices in place.

4. The recommendation is that the ground water users' average diversion budget analysis for the period from 1990-2006 not be accepted in determining a baseline supply to predict needs. There is much impressive work and much analysis that can be utilized in the reports and testimony. However, the end result would not lead to an acceptable baseline.

5. The conclusions in SWC's expert testimony are closer to being acceptable, but there are problems in areas of analysis that preclude outright acceptance of the conclusions. Again, there is useful analysis, but the conclusions are more likely to lead to yearly controversy than resolution, which unfortunately may be the fate of any baseline. The conveyance loss values do not appear reliable and the element of soil moisture does not appear to be adequately addressed.

6. The minimum full supply established in the May 2, 2005, Order is inadequate to predict the water needs of SWC on an annual basis. There are too many unaccounted variables in the minimum fully supply analysis to be continued in use as the baseline for predicting the likelihood of material injury.

7. In the absence of acceptable average budget analysis amounts from either party, the Department must modify the minimum full supply analysis as a method of establishing a baseline of predicted water need for projecting material injury. The use of the term "minimum full supply" has become a lightning rod of discontent for all parties. SWC focuses on "minimum," reading it to restrict their rights below the licensed or decreed amount. There is danger it may be applied in that fashion when it should not. The ground water experts focus on the term "supply," reading it to imply that the measure was based on how much water was available to SWC members regardless of whether needed or not. That too is a danger if misapplied. The approach adopted in the May 2, 2005, Order was a response to a call for curtailment which required a response. It was never intended as a final word. Within this context it is time for the Department to move to further analysis to meet the goal of the minimum full supply but with the benefit of the extended information and analysis offered by the parties and available to its own staff. It would be desirable to recommend the results of one or the other studies conducted by the parties. As indicated, that recommendation cannot be made. The analysis of each does, however, speak to the factors to be considered.

Properly applied the minimum full supply approach is an attempt to measure, for purposes of determining if there should be curtailment, the amount of water senior surface users need to raise crops of their choosing to maturity with the number of cuttings weather conditions will allow. Within this context there are issues of the reasonableness of diversion and conveyance practices, and the conservation efforts of the water users. Those are addressed separately in this recommendation. The concept of a baseline is that it is adjustable as weather conditions or practices change, and that those adjustments will occur in an orderly, understood protocol.

It is appropriate to use historical information when crops were adequately irrigated and to test that information to determine if the usage involved waste. The Director chose 1995 because it reflected a time when full headgate deliveries occurred and crops were apparently adequately irrigated. If 1995 could be considered an average irrigation year in all the factors to be considered in establishing a baseline average it would be acceptable in the absence of compelling reasons to accept either the ground water users' conclusions or SWC's conclusions. The isolation of a year when there are known facts as to the supply and use may be reasonable if it is subjected

to the type of analysis applied by both the surface and ground water users. However, focusing on a single year can only be a starting point, not sufficient without material adjustments. Those adjustments are reflected in the analyses of the ground water users and the surface water users in attempting to establish annual diversion requirements.

a. To the extent 1995 is utilized it should be adjusted to determine how much the need for irrigation water was depressed by the well-above average precipitation and how much less loss from evaporation there would have been from depressed temperatures compared to a normal temperature year. This would result in an increase in the baseline utilized by the Director. The objection that arriving at a baseline by using the amount delivered in a specific year emphasized supply rather than need is worthy of consideration. However, the evidence does not establish waste in the use of water in 1995. Absent evidence of waste it is appropriate to assume that the water was applied to a beneficial use.

b. If there have been significant cropping changes resulting in either greater or less need for water, those should be factored. This is an area of caution. Cropping decisions are matters for the irrigators acting within their water rights. Those decisions should be driven by the market. The fact that a particular crop may take less water does not dictate that it be planted.

c. Changes in facilities, diversion, conveyance, and irrigation practices from earlier years should be considered, e.g. the extent to which conversions to sprinklers have affected water use over time. This again must be considered with caution to avoid rewriting a water right through the process of determining a baseline water need for predictions of material injury. There may be legitimate reasons to revert to gravity flow in the future or change other practices.

d. Analysis of soil conditions to determine how water is retained or lost is a factor. Soil may hold water to be used by crops in the future. The fact that water may be applied to the ground when there are no plants growing does not mean the water is wasted. That depends on the nature of the soil and the amount of soil. Some soil retains water well, other does not. This affects the timing and extent of water delivery.

e. Non-irrigated acres should not be considered in determining the irrigation supply necessary for SWC members. IGWA has established that at least 6,600 acres claimed by TFCC in its district are not irrigated. Similar information was submitted concerning the Minidoka Irrigation District, indicating that the claimed acreage of 75,152 includes 5,008 acres not irrigated and Burley Irrigation District has some 2,907 acres of the 47,622 acres claimed not irrigated. These amounts may, of course, change as acreage is removed from irrigation or possibly added back.

f. Calculation of a water budget should be based on acres, not shares. The allocation of water within a district is a matter of internal management, but the calculation of a water budget in determining if there will be curtailment should be based on acres not shares.

g. Full headgate delivery for Twin Falls Canal Company should be calculated at 5/8 inch instead of 3/4 inch. The former Director accepted Twin Falls Canal Company's response that 3/4 inch constituted full headgate deliver, and TFCC continued to assert that position at hearing. This is contradicted by the internal memoranda and information given to the shareholders in the irrigation district. It is contrary to a prior judicial determination. It is inconsistent with some of the structural facilities and exceeds similar SWC members with no defined reason. Any conclusions based on full headgate delivery should utilize 5/8 inch.

8. The sources of information for reevaluating the water conditions should be expanded, as occurred in the sixth supplemental order when the Heise Gage was no longer a valid measure of natural flow. Initial use of the Heise Gage unregulated flow is reasonable as a starting point in predicting the water supply, but as the year progresses and adjustments become necessary other sources utilized by the irrigation districts to monitor and predict their water supplies should be included.

XV

THE REASONABLENESS OF THE SURFACE WATER COALITION'S DIVERSION SYSTEMS AND CONVEYANCE PRACTICES

An issue presented in this case is the efficiency of the various members of the Surface Water Coalition. This relates to considerations in CM Rule 42 which the Director may take into account in determining if there is material injury and the reasonableness of the amount of water diversions. The two ideas are related.

1. CM Rule 42.01g provides that in considering whether there is material injury to a senior water user and use of water by the senior without waste the Director may consider, "The extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices..." It is relevant to consider how much water is necessary to irrigate crops to maturity.

2. If the means of diversion utilizing existing facilities, the methods of conveyance, or the conservation practices are not reasonable the water wasted does not constitute material injury attributable to the junior ground water pumpers, even if the diversion is within the amount of the water right. Curtailment will not be invoked to make up for water lost through the use of unreasonable diversion or conveyance practices or unreasonable use of the water.

3. The existing facilities utilized by the Surface Water Coalition members are reasonable. The evidence does not show substandard facilities for diversion or conveyance. The members of the Surface Water Coalition have improved their conveyance practices since the time the water rights were licensed or decreed. All of the members have changed significant portions of their irrigation practices from gravity flow to sprinkler systems which generally deliver water to the crop more efficiently. Sprinkler practice is not perfect. Evidence from the Twin Falls Canal Company indicates that water from gravity flow that exceeds the need of the initial crop is captured and applied to other portions of the district by water paths that develop. The same process does not occur with sprinkler systems. Also, there are limitations with sprinklers on applying water into corner portions of property. Overall, however, the use of sprinklers is more efficient than gravity flow, and sprinklers are increasingly used by the

members of SWC. Additionally, at least Twin Falls Canal Company and North Side Canal Company have gone extensively to the use of computer monitoring of water use to assure its proper application.

There are various factors that might be considered that cause difference in the efficiency of diversion and conveyance within the irrigation districts. For example, the North Side Canal Company is very long, requiring more time for water to move from the initial diversion to the end of the system. There will be differences in the amount of evaporation and potentially of conveyance losses. Additionally, if the delivery of water at the beginning of the system is shut off, when the water is again turned on it takes considerable time for water to reach the far end of the system. Damage to the crops may occur during the delay. This simply says that there is no precise formula that can be applied from one SWC member to another. Differences exist. This does not mean that one district is using reasonable facilities and practices and another not. There is no evidence of decayed or damaged systems that are allowed to continue or practices that cause water to be wasted in transit. The evidence in this case indicates that each of the SWC members is operating with reasonable diversion and conveyance efficiency.

4. Full headgate delivery for Twin Falls Canal Company should be calculated at 5/8 inch instead of 3/4 inch. The former Director accepted Twin Falls Canal Company's response that 3/4 inch constituted full headgate deliver, and TFCC continued to assert that position at hearing. This is contradicted by the internal memoranda and information given to the shareholders in the irrigation district. It is contrary to a prior judicial determination. It is inconsistent with some of the structural facilities and exceeds similar SWC members with no defined reason. Any conclusions based on full headgate delivery should utilize 5/8 inch.

XVI

THE CONCEPT OF ACHIEVABLE FARM EFFICIENCY

Once it is determined that the systems of diversion and conveyance of the SWC members are reasonable, the question becomes whether that system is being operated reasonably. Are the practices in place reasonable in conserving water or are the SWC members claiming and using more water than is necessary to develop healthy crops to full maturity utilizing the systems and practices in place.

1. The concept of achievable farm efficiency. Pocatello offered the testimony of C. Eugene Franzoy, an expert in water management, who testified that "achievable farm efficiency is a measure of what the irrigation system is capable of achieving given the existing physical conditions." Mr. Franzoy differentiated between "farm efficiency" which refers to the actual efficiency of the farm operation as opposed to the "achievable farm efficiency" that he maintains can be achieved with existing physical conditions with a high level of management.

2. Reasonableness, not achievable farm efficiency, is the standard in determining whether irrigators are wasting water. CM Rule 42.01.g. provides that "in determining whether water rights holders are suffering material injury and using water efficiently and without waste" the Director may consider "[t]he extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by **employing reasonable diversion and conveyance efficiency and conservation practices... .**" (emphasis added). Achievable farm efficiency through a highly managed system is certainly desirable if the process of getting there is reasonable, but there are considerations other than the hypothetical most efficient use of water that limits that result. There are likely labor costs or associated management difficulties that must be considered in whether an irrigator can get the maximum benefit of water without on occasions exceeding that amount. The amount of those costs has not been identified but almost certainly exists. The irrigation districts have a limited scope of operation. They deliver water to the actual irrigators. There are a large number of irrigators. It would be speculation to determine the cost and the reasonableness of extending the districts' management into the realm of each irrigator.

The closer farm efficiency gets to achievable farm efficiency the better, but the fact that there is a difference does not mean the irrigation districts' practices are unreasonable. The lessons learned from analysis of achievable farm efficiency may be very valuable to irrigators, but the standard for determining whether water is being applied to a beneficial use without waste is whether the district is reasonable in the use of the water with existing diversion and conveyance facilities, consistent with reasonable conservation practices.

3. The members of the Surface Water Coalition are employing reasonable conservation practices. There is evidence the members of SWC monitor the use of water closely. It is very clear that during the drought period they did not apply the full extent of their

water rights throughout the irrigation season. They withheld water and rationed it according to conditions. Had they not used the water reasonably they likely would have suffered catastrophic losses.

4. If the Director identifies reasonable conservation practices that are not being utilized, the Director may consider that fact in future determination of need. This is not a static system, and as improvements either in technology or management practices that fall within reasonable costs are identified the Director may consider whether they have been implemented in making the decision of whether ground water pumpers should be curtailed.

XVII

THE RIGHT TO CARRYOVER STORAGE

1. The development of carryover storage was a response to the uncertainty when the flow of the Snake River was unregulated. The unregulated flow of the Snake River did not provide a reliable source of water for irrigators represented by SWC and other water users. Early runoff might well exceed the needs of irrigators and pass unused while later runoff was insufficient to meet crop needs. Reservoirs were developed to contain the water at times when it was not needed for irrigation, primarily the winter and early spring, and release it when most needed, principally July and August.

2. Some members are primarily dependent upon water held in storage, and their crop needs would seldom be met if they were dependent upon their natural flow rights. The Twin Falls Canal Company has a very early and large natural flow right which commands much of the natural flow of the Snake River. The North Side Canal Company has the same early priority to natural flow, but its early priority right is much smaller than that of the Twin Falls Canal Company. NSCC relies upon a very large storage right, as do other members of the Surface Water Coalition. All members of SWC hold storage water rights that are prior in time to the ground water rights held by IGWA.

3. Storage water rights are entitled to protection but are subject to defenses, as are the natural flow rights. Idaho Code section 42-607 does not classify storage water differently from natural flow. But for the reservoir system it would all be natural flow. Conjunctive

Management Rule 10.25 defines a water right as, "The legal right to divert and use or to protect in place the public waters of the state of Idaho where such right is evidenced by a decree, a permit or license issued by the Department, a beneficial or constitutional use right or a right based on federal law." In *American Falls Reservoir District No. 2 v. Idaho Department of Water Resources,* 143 Idaho 862, 880, 881, 154 P. 3d 433, 451,452 (2007), the Supreme Court stated the law:

> The district court's decision is based on the assumption that storage rights are property rights entitled to legal protection. *Washington County Irrigation Dist. v. Talboy,* 55 Idaho 382, 385, 43 P.2d 943, 945 (1935). In *Talboy*, this Court held that when water is stored, it becomes "the property of the appropriators ... impressed with the public trust to apply it to a beneficial use." *Id.* Importantly, *Talboy* did not address the issue of carryover. The Court has also held that if one appropriates water for a beneficial use, he has a valuable right entitled to protection. *Murray v. Public Utilities Comm'n,* 27 Idaho 603, 619, 150 P. 47, 50 (1915); *Bennett v. Twin Falls North Side Land & Water Co.* 27 Idaho 643, 651, 150 P. 336,339 (1915). Nevertheless, that property right is still subject to other requirements of the prior appropriation doctrine.

The former Director's description of storage water being supplemental in finding 72 of the May 2, 2005, Order can be misleading in appearing to minimize the significance of the storage rights. However, his explanation in testimony clarifies that this description relates to the order of use of natural flow and storage rights. That is, natural flow rights must be exercised before a call by a senior user can be made. The storage water rights are considered after the natural flow rights have been utilized. The storage water rights are protected and subject to defenses.

4. SWC members are entitled to carry over the entire amount of their contracted storage rights when there is sufficient water and curtailment is not sought. There has been some confusion caused by the Director's perceived limitation on carryover storage. The Director did not rewrite the contracts the irrigation districts have with BOR or interfere with the right to carryover storage water when available. The limitation only applies to an amount to be obtained from curtailment or mitigation water from the ground water users. If the irrigation district's needs for carryover can be met without curtailment, there will be zero carryover storage provided by curtailment or replacement. There is still a right to as much carryover as water supplies will provide within the limits of the contract. The perception that the Director determined some irrigation districts were not entitled to carryover storage is in error.

5. There is a right to reasonable carryover of storage water and there may be curtailment or a requirement of mitigation to meet that amount. IGWA and Pocatello have presented expert testimony and argument that there is no basis for curtailment when a surface water user has unused water in storage in the reservoirs. It is not an unreasonable argument and, if adopted, would simplify analysis in this case in light of the fact that in 2005, 2006, and 2007 the Coalition members had some positive balance in their storage accounts, though Twin Falls Canal Company's positive balance in the last year results from the rental of 40,000 acre-feet. The logic of the ground water users' position is that it is a question of timing and that it places the issue of curtailment or mitigation in the actual year of shortage, not in a prospective analysis that might never develop if there is sufficient water in storage to meet irrigation needs. However, the position advocated by IGWA and Pocatello runs contrary to the Conjunctive Management Rules, the decision of the Idaho Supreme Court, and the history defining the purposes of the elaborate BOR reservoir system. Conjunctive Management Rule 42.01.g. provides the following:

DETERMINING MATERIAL INJURY AND REASONABLENESS OF WATER DIVERSIONS (RULE 42).

Factors. Factors the Director may consider in determining whether the holders of water rights are suffering material injury and using water efficiently and without waste include, but are not limited to, the following:

> **g.** The extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices; provided, however, **the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years. In determining a reasonable amount of carry-over storage water, the Director shall consider the average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system.** (emphasis added).

The Supreme Court reviewed the law relative to carryover in *AFRD #2, p. 881,* distinguishing *Glavin v. Salmon River Canal Co.,* 44 Idaho 583, 258 P. 532 (1927), which "invalidated a rule adopted by a canal company that allowed an individual shareholder of the company to hold-over his allotted share of stored water free from limitations, which reduced the allocated amount of other shareholders." The Supreme Court noted that *Rayl v. Salmon River Canal Co.,* 66 Idaho 199, 157 P.2d 76 (1945), limited *Glavin* to the facts in that case. The Court

in *AFRD #2* stated a "recognition that it is permissible for the canal company to hold water over from one year to the next absent abuse." However that right has limitations:

> Concurrent with the right to use water in Idaho "first in time," is the obligation to put that water to beneficial use. To permit excessive carryover of stored water without regard to the need for it, would be in itself unconstitutional. The CM Rules are not facially unconstitutional in permitting some discretion in the Director to determine whether the carryover water is reasonably necessary for future needs. *Id.*

6. When calling for curtailment of junior ground water users there are limitations on the rights to carryover storage water from curtailment. AFRD # 2 establishes that there is a balance between the right to carryover storage water and limitations upon that right:

> At oral argument, one of the irrigation district attorneys candidly admitted that their position was that they should be permitted to fill their entire storage water right, regardless of whether there was any indication that it was necessary to fulfill current or future needs and even though the irrigation districts routinely sell or lease the water for uses unrelated to the original rights. This is simply not the law of Idaho. While the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception. As previously discussed, the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost. Somewhere between the absolute right to use a decreed water right and an obligation not to waste it and to protect the public's interest in this valuable commodity, lies an area for the exercise of discretion by the Director. This is certainly not unfettered discretion, nor is it discretion to be exercised without any oversight. That oversight is provided by the courts, and upon a properly developed record, this Court can determine whether that exercise of discretion is being properly carried out. For the purposes of this appeal, however, the CM Rules are not facially defective in providing some discretion in the Director to carry out this difficult and contentious task. This Court upholds the reasonable carryover provisions in the CM Rules. *AFRD # 2, p. 882*

7. The history of the development of the reservoir system, most recently Palisades, makes it clear that storage of water was a primary purpose to prevent disaster during periods of shortage as have been experienced in the recent past. The reservoir system tamed the river and contained runoff for a particular year so water could be used when needed. Irrigators could invest substantially in the development and improvement of delivery systems and crop planning knowing that water would be available.

8. The ground water pumping at issue in this case developed subsequent to the storage rights under consideration. Ground water users developed their rights against the

background of an existing system that was designed with storage as a primary purpose in coordination with the development of substantial surface irrigation systems dependent upon the storage water. The contractual rights to the storage water were in place when ground water pumpers entered the arena.

9. The amount of carryover storage is limited by the elusive concept of reasonableness, restricting curtailment to fulfilling the licensed or adjudicated purpose of the storage. In *AFRD # 2* the Supreme Court made it clear that there are standards of reasonableness that may limit the absolute right to fill storage rights completely if curtailment is required to do so. The Court specifically noted that some irrigation districts sell or lease storage water rights for purposes unrelated to the original right. *Id.* 882. The thrust of the Court's comment is that curtailment cannot be utilized to make up storage water that is disposed of in that process. Consequently, in determining the amount of carryover storage to which the irrigation districts are entitled when curtailment is ordered, the amount of water sold or leased for purposes outside the licensed or adjudicated right must not be considered in calculating a shortage. The ground water users have no obligation to make up for water that will not be applied to its licensed or adjudicated purpose, e.g. the sale of water for flow augmentation. If the water is sold to another irrigator who has a priority over the ground water users and is applied to a beneficial purpose within the licensed or adjudicated right, the ground water users would be liable for remediation to one surface water holder or the other if the necessity for rental arose out of ground water depletions. Also, a different question as to the requirement of the ground water users to provide flow augmentation would be presented if the requirement for augmentation were to arise from a mandate without compensation to the surface water users. Were that the case the ground water users would be subject to a contribution for their depletion of the river.

10. According to the May 2, 2005, Order the initial determination of carryover storage was to be made at the beginning of the irrigation season to project if there would be a shortage to be addressed by replacement water. The approach utilized by the former Director was that early in the irrigation year a determination would be made as to the amount of carryover storage to which the various surface water districts were entitled. The ground water users were obliged to contract to provide replacement water during the irrigation season or face curtailment in the event of shortages. The amount of replacement water was due in the current

irrigation season. Thereafter there would be adjustments depending on whether too much or too little storage water had been provided through the contractual agreements made by the ground water users. If the amount provided was insufficient the obligation would be carried over to the next year. The process of year end accounting would continue until a time when there was fill of the reservoirs which would erase the debits and credits. Tr., Vol. II, pp. 353-355.

11. Curtailment or mitigation to provide sufficient carryover storage for one year is reasonable. The multiple functions of BOR and the desire of SWC for long term insurance against adverse weather conditions are legitimate and consistent with the language of CM Rule 42.01.g. which refers to dry **years.** Nonetheless, attempting to curtail or to require replacement water sufficient to insure storage for periods of years rather than the forthcoming year presents too many problems and too great a likelihood for the waste of water to be acceptable. Curtailing to hold water for longer than a year runs a serious risk of being classified as hording, warned against by the Supreme Court in *AFRD #2.*

The climate is sometimes generous and sometimes stingy with precipitation, neither of which under the current state of science is predictable for anything more than relatively short terms. Anticipating more than the next season of need is closer to faith than science. Ordering curtailment to meet storage needs beyond the next year is almost certain to require ground water pumpers to give up valuable property rights or incur substantial financial obligations when no need would develop enough times to warrant such action.

12. There is no precise amount of reasonable carryover storage, but the amount should be sufficient to assure that if the following year is a year of water shortage there will be sufficient water in storage in addition to whatever natural flow rights exist to fully meet crop needs. When the reservoir system was developed long term planning anticipated a system that would provide insurance against water shortage for a period of years. As indicated,

requiring curtailment to reach beyond the next irrigation season involves too many variables and too great a likelihood of irrigation water being lost to irrigation use to be acceptable within the standards implied in *AFRD #2.* However, the element of storage as insurance against severely dry weather conditions remains a legitimate objective. SWC members have invested in major facilities to deliver water to irrigators based on an expectation that the storage system would achieve its purpose of providing water when needed when weather conditions are unkind.

13. The amount of carryover to be provided by curtailment or replacement has fallen short in instances of meeting the standard of reasonable carryover. In 2007 Twin Falls Canal Company would have ended with a negative balance in its carryover except for its prophylactic action of renting 40,000 acre-feet of water at a cost close to $850,000. Considering the much greater dependence of other members of SWC on storage water, cutting the margin close threatens the ability to meet crop needs. It also shifts the risk from junior water users to senior users. A conclusion of this recommendation is that the use of the year 1995 to establish the minimum full supply of water underestimated the amount of water necessary to meet the needs of SWC members within their water rights. This had the collateral effect of underestimating the amount of carryover storage that is reasonable to meet future crop needs.

14. Conjunctive Management Rule 42.01.g. sets some guidelines for determining "a reasonable amount of carry-over storage to assure water supplies for future dry years. In determining a reasonable amount of carry-over storage water, the Director shall consider the average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system." The steps this appears to anticipate is to first determine the average annual rate of fill of the storage reservoirs. This establishes the standard for carryover. The next step is to examine current water

conditions against prior comparable water conditions and project the water supply for the system. If that projection falls below the average annual rate, it would follow that the shortage attributable to ground water depletion should be made up by curtailment or replacement water. If the projection indicates the amount of fill will exceed the average annual rate, there would be no right to curtailment, even if that average annual rate falls below fill of the system.

The average rate of fill should be determined over a sufficient number of years to encompass wet and dry years. It would seem that this calculation should begin with the year in which Palisades was first fully operational. That would encompass the entire reservoir system as it now exists and include years when the effect of ground water pumping was minimal.

CM Rule 42.01.g. envisions evaluating the system as a whole to determine rates of fill and storage. This should establish a basis for the determination of reasonable carryover for the system. Within that system each SWC member has a right to reasonable carryover storage which must be allocated. Depending on priorities, some spaceholders will suffer no material injury from ground water pumping because their senior storage rights will fill and meet their needs, whereas others may suffer material injury because of their lesser priority. As noted earlier, the right to secure reasonable carryover storage through curtailment does not extend to make up for water that is sold or leased "for uses unrelated to the original rights." *AFRD #2, p. 882.*

XVIII

THE RIGHT TO ORDER REPLACEMENT WATER INSTEAD OF CURTAILMENT

1. **A replacement water plan should go through the procedural steps for approval of a mitigation plan.** The former Director has approved replacement water plans, allowing the ground water users to avoid curtailment. Conjunctive Management Rule 40.01.a. provides that the Director, acting through the watermaster may:

> Regulate the diversion and use of water in accordance with the priorities of rights of the various surface or ground water users whose rights are included within the district, provided that regulation of junior priority ground water diversion and use where the material injury is delayed or long range may, by order of the Director, be phased-in over not more than a five-year (5) period to lessen the economic impact of immediate and complete curtailment.

The process of phased in curtailment extends to a mitigation plan approved by the Director pursuant to CM Rule 40.01.b.

CM Rule 43 sets forth the process for consideration of a mitigation plan which allows out of priority pumping and avoids curtailment. The Rule requires notice and hearing for consideration of a mitigation plan:

> "Upon receipt of a proposed mitigation plan the Director will provide notice, hold a hearing as determined necessary, and consider the plan under the procedural provisions of Section 42-222, Idaho Code, in the same manner as applications to transfer water rights."

The replacement water plan approved by the former Director in the May 5, 2005, Order and Supplemental Orders is in effect a mitigation plan. However, it does not appear that the procedural steps for approving a mitigation plan were followed. The initial Order was entered in an emergency situation in which there was a call for administration in times of stress on the water supply. It was anticipated that there would be a protocol for the presentation of objections, but litigation over the validity of the Conjunctive Management Rules apparently sidetracked development of that process. At this stage of the proceedings there will be ongoing administration, and the procedural steps for a mitigation plan should be developed. In the absence of a pre-approved mitigation plan, after the Director has made a determination of material injury which would warrant curtailment, a mitigation plan for replacement water or other forms of mitigation may be considered in accordance with the procedural steps of CM Rule 43. If no plan is approved and there is a finding of material injury, curtailment must follow.

2. Replacement water has not been provided in the season of need. When a determination is made that surface water users are suffering material injury from ground water pumping, they are entitled to curtailment or replacement water in the season of material injury. The theory underlying predicting material injury and allowing replacement water as mitigation

instead of requiring curtailment is that the replacement water will be provided in time and in place in stages comparable to what would occur if curtailment were ordered.

3. Replacement water in season may occur either by IGWA obtaining lease water before the beginning of irrigation season and transferring the right to the water to the SWC members or underwriting the affected SWC members in their acquisition of the water as needed with a year end accounting. Either protocol supplies the water in season. Whichever process is adopted, it should be in place at the beginning of the time irrigation water will be applied to the fields so the effect will be the same as would result from curtailment. Notice of the process should be given to the affected parties in advance so objections may be heard and the procedural steps of CM Rule 43 applied.

XIX

THE CONCEPTS OF A "TOTAL WATER SUPPLY' AND "FULL HEADGATE DELIVERY"

1. Two elements to the Surface Water Coalition water rights must be considered – natural flow and storage rights. SWC challenges the Director's use of a "total water supply" analysis, combining natural flow rights and storage rights to determine if there was injury and a need for curtailment. SWC maintains that the Director compounded the error by analyzing the question of injury by use of the "full headgate delivery" analysis to reach the conclusion that if the combination of natural flow and storage water provided a full headgate of water there was no injury. According to SWC natural flow rights and storage should be addressed separately. The natural flow right may suffer injury from junior out of priority diversion, and the storage right may also suffer injury by the out of priority diversion. SWC argues that requiring the senior right holder to use storage water to make up the shortage of natural flow amounts to self-mitigation that damages the storage right. SWC is correct in the position that each element of their rights must be analyzed. However, if the damage to the "total water supply" is properly recognized, the harshness identified by SWC is ameliorated.

2. All SWC members rely upon a combination of natural flow and storage water to meet their needs. That is their total water supply. There is an accounting process that takes place in the management of the water assigning portions to natural flow and storage. Water

comes and is used. It may be from natural flow, as all water would be if there were not reservoirs, or it may be storage. The source of the water is not significant to the crop. It is significant to accounting and allocating rights.

3. In analyzing a total water supply to determine if there is material injury each element of the water rights should be considered and proper recognition is given to the right to carryover storage – there may be material injury to the right of reasonable carryover storage if the provision of full headgate delivery exhausts what would otherwise be the reasonable carryover storage amount. The first step in deciding if there is material injury should be to determine how much a surface water user's natural flow right has been diminished by junior ground water pumping. Evidence indicates that there has been a long term trend of declining natural flow water, causing the members of SWC to begin the use of storage water earlier and to a greater extent. The diminution of natural flow results in a reduction of the storage water right by the amount of water withdrawn from storage to meet the need that could not be met by the natural flow right as a consequence of ground water pumping. All SWC members are entitled to reasonable carryover storage. If depletion of the storage right to make up the loss of natural flow reduces the amount of carryover storage below the level of reasonable carryover there is **material** injury and that amount must be made up through curtailment or replacement, or another form of mitigation.

4. If crop needs are met by the combined use of natural flow and storage water and there is sufficient water for reasonable carryover, there is no material injury. This assumes that crop needs are fully met. Curtailment, however, only extends to providing the amount of water necessary to replace ground water depletions to reasonable carryover storage.

CONCLUSION

This opinion constitutes the findings of fact and conclusions of law and recommendations resulting from the hearing on the Surface Water Coalition call and the objections that have been made by the parties to the Orders that have been entered in the aftermath of that call. The format is intended for the ease of tracking the issues discussed. The context of the sections should make it clear what determinations are findings of fact and which are conclusions of law.

Dated 29, April, 2008.

Attorneys for A&B Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE MITIGATION PLAN FILED BY A&B IRRIGATION DISTRICT FOR THE DISTRIBUTION OF WATER TO WATER RIGHTS HELD BY THE SURFACE WATER COALITION	)	**CM-MP-2015-_____**
	)	**A&B IRRIGATION DISTRICT'S AMENDED RULE 43 MITIGATION PLAN**

COMES NOW, A&B IRRIGATION DISTRICT ("A&B" or "District"), by and through its counsel of record, BARKER ROSHOLT & SIMPSON LLP, and hereby submits this Mitigation Plan ("Plan") pursuant to Rule 43 of the Department's Conjunctive Management Rules (37.03.11.43) in the above-captioned matter for A&B's ground water rights: 36-2080, 36-15192, 36-16749, 36-15127A, 36-15193A, 36-15194A, 36-15195A, 36-15196A, 36-15127B, 36-15193B, 36-15194B, 36-15195B, and 36-15196B.

As detailed below, diversion of ground water under A&B's water rights subject to any future curtailment orders issued by the Director in response to the Surface Water Coalition delivery call can be fully mitigated with various actions undertaken by the District.

MITIGATION PLAN

I. Name and Address:

A&B Irrigation District
P.O. Box 675
Rupert, Idaho 83350-0675
(208) 436-3152

II. Water Rights to be Mitigated By Plan:

36-2080
36-16192
36-16749
36-15127A
36-15193A
36-15194A
36-15195A
36-15196A
36-15127B
36-15193B
36-15194B
36-15195B
36-15196B

III. Description of Plan:

A&B originally filed a mitigation plan for this delivery call on May 12, 2005. At that time, the Idaho Ground Water Appropriators moved to consolidate proceedings on its mitigation plan with other plans, including A&B's. The former Director denied IGWA's request and further indicated that he would take action on A&B's plan "as soon as practicable after it is submitted." *See Order Granting Extension of Time to File Mitigation Plan* at 2 (May 6, 2005); *see also, Order Regarding Protests and Motions to Dismiss Mitigation Plan et al.* at 22 (September 13, 2005). After consultation with Department counsel Garrick Baxter it appears that notice of A&B's mitigation plan was never published, and no order was ever issued approving the plan. Accordingly, A&B is filing this amended plan to follow the required

procedures. Further, since A&B has undertaken additional actions since 2005, the District is filing this amended plan for consideration.

First, A&B has curtailed the diversion of groundwater under its senior priority water right (36-2080) for the irrigation of 1,377.8 acres within the Unit B portion of the irrigation district. *See* Ex. A. A&B has converted the 1,378 acres (Ex. A) from groundwater to a surface water supply, consisting of stored water in American Falls and Palisades Reservoirs (water right nos.1-2064, 1-2068). In addition, landowners within A&B have enrolled 121 acres in the federal CREP program (Ex. B). The District's curtailment of groundwater pursuant to these actions has previously been found to mitigate for depletions caused by certain junior ground water rights used within the District. *See e.g.*, *Final Order Approving Mitigation Plans (Blue Lakes Delivery Call)* (May 7, 2010); *Final Order Approving Mitigation Plan (Rangen Delivery Call)* (April 28, 2014).

Second, A&B is in the process of developing a second pumping plant and pipeline project to deliver available surface water to lands served by senior ground water right 36-2080. The District will provide available surface water to these "soft conversions." For example, the District recently obtained water right permit 1-10633 for the use of available natural flow in the Snake River for the irrigation of 1,478 acres currently irrigated with ground water (Ex. C).

Finally, A&B holds rights to storage water in American Falls Reservoir (46,826 af) and Palisades Reservoir (90,800 af) and has the ability to participate in Water District 01's Rental Pool. Available storage, if necessary, can be rented and delivered to injured Coalition members to mitigate for any shortfalls caused by the District's junior priority ground water that are subject to curtailment. This action would only be necessary if the benefits of the above conversions and CREP action did not satisfy the injury caused by A&B's ground water rights that are found to be

subject to curtailment.

Although the Director has not yet issued a curtailment order this year, certain junior priority ground water rights (i.e. junior to 1982[1]) may be subject to future orders. As detailed above, it is anticipated that A&B's actions will completely mitigate for the depletions resulting from the use of any ground water rights subject to curtailment. The Mitigation Plan provides replacement water "at the time and place required by the senior-priority water right, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source at such time and place as necessary to satisfy" injured senior surface water rights held by the Coalition, including A&B. *See* CMR 43.03.b.

A&B reserves the right to develop approved procedures with IDWR to identify and determine the respective percentage obligation of its junior priority rights subject to curtailment and the required mitigation.

REQUEST FOR RELIEF

A&B hereby requests IDWR to process this plan as soon as possible. A&B further requests the Director to approve this plan in conformance with the procedures and criteria set forth in CMR 43.

DATED this 21st day of May, 2015.

BARKER ROSHOLT & SIMPSON LLP

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE MITIGATION PLAN FILED BY A&B IRRIGATION DISTRICT FOR THE DISTRIBUTION OF WATER TO WATER RIGHTS HELD BY THE SURFACE WATER COALITION	Docket No. CM-MP-2015-003 **FINAL ORDER APPROVING MITIGATION PLAN**

The Director ("Director") of the Idaho Department of Water Resources ("Department") finds, concludes and orders as follows:

FINDINGS OF FACT

1. On May 12, 2005, the Department received A&B Irrigation District's ("A&B") *Request for Approval of Mitigation Plan of A&B Irrigation District* filed in the Surface Water Coalition ("SWC") delivery call case. This mitigation plan was not published by the Department and no order was issued approving the plan.

2. On May 21, 2015, the Department received *A&B Irrigation District's Amended Rule 43 Mitigation Plan* ("Amended Mitigation Plan"). The Amended Mitigation Plan was submitted pursuant to Rule 43 of the Department's Rules for Conjunctive Management of Surface and Ground Water Resources ("CM Rules"). IDAPA 37.03.11.043.

3. The Amended Mitigation Plan has four components. The first component seeks mitigation approval for conversions from ground water irrigation to surface water irrigation. A&B converted 1,378 acres from ground water to surface water supplies and A&B seeks mitigation approval for the conversions. *Amended Mitigation Plan* at 3.

4. The second component seeks mitigation approval for acres enrolled in the federal Conservation Reserve Enhancement Program ("CREP"). *Id.* A&B sought and received mitigation approval for its existing ground water to surface water conversion project and its CREP acres in the Rangen delivery call case. *See Final Order Approving Mitigation* Plan, In the Matter of the Mitigation Plan Filed by A&B Irrigation District for the Distribution of Water to Water Right Nos. 36-02552 & 36-07694 in the Name of Rangen, Inc., (April 28, 2014).

5. The third component seeks mitigation approval for a future ground water to surface water conversion project. A&B is "in the process of developing a second pumping plant

and pipeline project to deliver available surface water to lands served by senior ground water right 36-2080" and seeks mitigation approval for the future conversion project. *Id.*

6. The fourth component seeks to mitigate using A&B's storage water in American Falls Reservoir and Palisades Reservoir, or to rent storage water through Water District 01's Rental Pool. *Id.*

7. Notice of the Amended Mitigation Plan was published in the Idaho Mountain Express and the Mountain Home News, beginning June 3, 2015, and ending on June 10, 2015. The notice was also published in the Times News beginning on June 4, 2015, and ending on June 11, 2015. No protests were received.

CONCLUSIONS OF LAW

1. Idaho Code § 42-602, addressing the authority of the Director over the supervision of water distribution within water districts, provides:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

2. In addition, Idaho Code § 42-1805(8) authorizes the Director to "promulgate, adopt, modify, repeal and enforce rules implementing or effectuating the powers and duties of the department."

3. Idaho Code § 42-603 grants the Director authority to adopt rules governing water distribution. In accordance with chapter 52, title 67, Idaho Code, the Department adopted rules regarding the conjunctive management of surface and ground water effective October 7, 1994. CM Rule 0. The CM Rules prescribe procedures for responding to a delivery call made by the holder of a senior-priority surface or ground water right against junior-priority ground water rights in an area having a common ground water supply. CM Rule 1.

4. CM Rule 42.02 states: "The holder of a senior-priority surface or ground water right will be prevented from making a delivery call for curtailment of pumping of any well used by the holder of a junior-priority ground water right where use of water under the junior-priority right is covered by an approved and effectively operating mitigation plan."

5. CM Rule 43.01 (a-d) sets forth the criteria for submission of a mitigation plan to the Director.

6. CM Rule 43.03 establishes the factors that may be considered by the Director in determining whether a proposed mitigation plan will prevent injury to senior rights. A factor that may be considered by the Director includes "whether the mitigation plan will provide replacement water, at the time and place required by the senior-priority water right … ."

7. In the SWC delivery call, the mitigation obligation owed by ground water users varies from year to year. Only after a curtailment order is issued can the Department determine whether A&B's mitigation activities fully mitigate for the depletions caused by A&B's junior-priority ground water diversions. However, the mitigation activities proposed by A&B are the type of activities that can provide replacement water at the time and place required by the senior-priority water rights. The plan should be approved but conditioned upon confirmation that A&B's mitigation activities fully mitigate for depletions caused by A&B's junior-priority ground water diversions in each year that a curtailment order is issued.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED as follow:

The Amended Mitigation Plan submitted by A&B is APPROVED conditioned upon confirmation that A&B's mitigation activities fully mitigate for depletions caused by A&B's junior-priority ground water diversions in each year that a curtailment order is issued. Upon issuance of a curtailment order in the SWC delivery call case, A&B shall submit documentation of mitigation activities to the Department for the Director to determine whether the Amended Mitigation Plan fully mitigates for A&B's junior-priority ground water diversions.

DATED this 16th day of December, 2015.

Gary Spackman
Director

CERTIFICATE OF SERVICE

Deborah J. Gibson

Deborah Gibson
Admin. Assistant for the Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **FINAL ORDER REGARDING APRIL 2016 FORECAST SUPPLY** **(METHODOLOGY STEPS 1 – 3)**

FINDINGS OF FACT

1. On April 15, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued his *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies steps 1, 2, and 3 of the Methodology Order.

A. Step 1

2. Step 1 requires members of the SWC to submit electronic shape files delineating the total irrigated acres to the Department by April 1, "or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent." *Methodology Order* at 35.

3. On February 10, 2016, Minidoka Irrigation District ("Minidoka") submitted its electronic shape files delineating its total irrigated acres to the Department.

4. On February 10, 2016, the Department received a letter from American Falls Reservoir District #2 ("AFRD2"), stating that its total number of irrigated acres has not varied by more than five percent.

5. On March 7, 2016, the Department received a letter from A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), Milner Irrigation District ("Milner"), North Side Canal Company ("NSCC") and Twin Falls Canal Company ("TFCC"), stating that their total

number of irrigated acres for 2016 will not vary by more than five percent from the electronic shape files submitted in prior years.

6. Based on the information submitted by the SWC, the Department will use the following total irrigated acres:

	Total Irrigated Acres	Data Source
A&B	15,924	SRBA Partial Decree
AFRD2	62,361	SRBA Partial Decree
BID	46,035	2013 shapefile submitted by BID, reduced by Department for overlapping acres and acres outside of service area.
Milner	13,335	SRBA Partial Decree
Minidoka	74,692	2016 shapefile submitted by Minidoka, reduced by Department for overlapping acres and acres outside of service area.
NSCC	154,067	SRBA Partial Decree
TFCC	194,732	2013 shapefile submitted by TFCC, reduced by Department for overlapping acres and acres outside of service area.

B. Step 2

7. Step 2 states that, within fourteen days of the issuance of the joint forecast ("Joint Forecast") prepared by the United States Bureau of Reclamation and the United States Army Corp of Engineers, the Director "will issue a final order predicting the April [Forecast Supply] for the water year for each SWC entity. The Director will compare the April [Forecast Supply] for each SWC entity to the [Baseline Demand] for each SWC entity to determine if a demand shortfall ("DS") is anticipated for the upcoming irrigation season." *Methodology Order* at 36.

8. On April 5, 2016, the Joint Forecast was announced, predicting an unregulated inflow of 3,200,000 acre-feet at the Snake River near Heise gage for the period of April through July. The Joint Forecast "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." *Methodology Order* at 17. The forecasted flow volume equates to 99% percent of average.[1]

9. The Heise natural flow data from years 1990 – 2015 were data inputs for development of regression equations for A&B and Milner to predict the natural flow supply.[2]

[1] The average is based on years 1981-2010.

[2] Attached hereto are the regression analyses for each SWC entity used to predict natural flow supply.

Data greater or less than two standard deviations from average were excluded from the regression development.

10. The April-July Heise natural flow data from the years 1990 – 2015 and Box Canyon November-March total discharge data for the period 1989 –2015, were data inputs for development of multiple linear regression equations to predict the natural flow supplies for AFRD2, BID, Minidoka, NSCC, and TFCC. *Methodology Order* at 17-18. The U.S. Geological Survey measures and monitors the flow at the Box Canyon stream flow measurement gage. The Box Canyon November-March total discharge used in the regression models by the Director for 2016 totaled 94,500 acre-feet.

11. The storage allocations were predicted for each SWC member. As of the April 1, 2016, preliminary water right accounting, the reservoir rights were 1,050,200 acre-feet from being satisfied. The water rights for Lake Walcott, Palisade Winter Water Savings, and American Falls Winter Water Savings space have been satisfied. Based on a comparison of the current Heise natural flow forecast to other analogous years (1991, 1993, 2006, 2012 and 2015), the Director anticipates the remaining reservoir water rights will be satisfied and the SWC will receive a full allocation. The storage allocations are based on the anticipated full allocation minus evaporation charges.

12. Based on the above, the Director predicts as follows:

	Predicted Natural Flow Supply	Predicted Storage Allocation	Minidoka Credit Adjustment	Total Supply	BLY 06/08/12	Shortfall
A&B	9,948	134,185		144,133	59,993	-
AFRD2	81,396	383,711	1,000	466,108	427,672	-
BID	96,748	220,825	5,130	322,703	251,531	-
Milner	13,845	87,215		101,060	47,135	-
Minidoka	135,991	352,320	8,370	496,681	369,492	-
NSCC	411,223	838,401	(7,750)	1,241,874	978,888	-
TFCC	782,816	239,782	(6,750)	1,015,848	1,060,011	44,200
				Total Predicted Demand Shortfall (AF)		44,200

C. Step 3

13. Step 3 requires the following:

> Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April DS unless the April DS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

Methodology Order at 36.

14. The April predicted DS for TFCC is 44,200 acre-feet and the total predicted DS is 44,200 acre-feet.

CONCLUSIONS OF LAW

1. The Fifth Judicial District Court, in and for the County of Minidoka, held that the evidentiary standard of proof to apply in conjunctive administration of hydraulically connected water rights is clear and convincing. *Memorandum Decision and Order on Petitions for Judicial Review*, CV-2009-000647 (Fifth Jud. Dist., May 4, 2010); *Memorandum Decision and Order on Petitions for Rehearing*, CV-2009-000647 (Fifth Jud. Dist., Nov. 2, 2010).

2. "Clear and convincing evidence refers to a degree of proof greater than a mere preponderance." *Idaho State Bar v. Topp*, 129 Idaho 414, 416, 925 P.2d 1113, 1115 (1996) (internal quotations removed). "Clear and convincing evidence is generally understood to be '[e]vidence indicating that the thing to be proved is highly probable or reasonably certain.'" *State v. Kimball*, 145 Idaho 542, 546, 181 P.3d 468, 472 (2008) citing *In re Adoption of Doe*, 143 Idaho 188, 191, 141 P.3d 1057, 1060 (2006); *see also Idaho Dept. of Health & Welfare v. Doe*, 150 Idaho 36, 41, 244 P.3d 180, 185 (2010).

3. In 2016, the Director has sufficient information to quantify irrigated areas for each of the SWC members as required by Step 1.

4. The Joint Forecast predicts an unregulated inflow of 3,200,000 acre feet at the Snake River near Heise gage for the period of April through July. The forecasted flow volume equates to 99% of average.

5. The April predicted DS is 44,200 acre-feet. Junior ground water users holding consumptive water rights bearing priority dates junior to February 8, 1989, within the Eastern Snake Plain Aquifer area of common ground water supply[3] must mitigate for their proportionate share of the predicted DS in accordance with an approved mitigation plan.[4] Junior ground water users mitigating with a secured volume of water pursuant to an approved mitigation plan must, to the satisfaction of the Director, secure their proportionate share for delivery to the injured members of the SWC on or before May 3, 2016. There was no carryover shortfall in the fall of 2015, junior ground water users did not secure any mitigation water for a carryover shortfall, and there is no adjustment to the mitigation obligation.

6. If, on or before May 3, 2016, ground water users holding consumptive water rights bearing priority dates junior to February 8, 1989, within the Eastern Snake Plain Aquifer area of common ground water supply fail to establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 44,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user. Junior ground water users who are mitigating with a secured volume of water are not required to assign the secured volume of water until after the Director issues a subsequent order requiring assignment of the water.

7. If, at any time prior to the Director's final determination of the April Forecast Supply, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, predicted DS determination.

---

[3] The Director must utilize the best available technology for determining the impact of junior ground water diversions. *See Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 816, 252 P.3d 71, 97 (2011). ESPAM 1.1 was the model version utilized in SWC delivery call proceedings. ESPAM 2.1 is the latest version of the ESPAM model and superseded ESPAM 1.1. The Director has determined that ESPAM 2.1 is the best available scientific tool for predicting the effects of ground water pumping. *See In re Water to Water Right Nos. 36-02551 & 36-07694 (Rangen, Inc.) IDWR Docket CM-DC-2011-004*, No. 42775, 2016 WL 1130276, at *4 (Idaho Mar. 23, 2016). Because no trim line has been determined utilizing ESPAM 2.1 in the SWC delivery call matter, in an exercise of discretion, the Director did not apply a trim line in determining the February 8, 1989, priority date.

[4] There are three approved mitigation plans in place responding to the SWC delivery call filed by: 1) A&B Irrigation District, 2) Southwest Irrigation District and Goose Creek Irrigation District (collectively, "SWID"), and 3) the Idaho Ground Water Appropriators, Inc. ("IGWA"). A&B Irrigation District's proportionate share of the predicted DS of 44,200 acre-feet is 3,463 acre-feet. SWID's proportionate share of the predicted DS of 44,200 acre-feet is 956 acre-feet. Due to the nature of SWID's mitigation plan, SWID does not need to establish that it can mitigate for its proportionate share of the predicted DS. The remaining share of the predicted DS is 39,783 acre-feet. The Department does not have sufficient information to determine IGWA's proportionate share of the remainder because the Department does not have an accurate list of all ground water rights covered under IGWA's mitigation plan.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED as follows:

The Director predicts an in-season DS of 44,200 acre-feet. On or before May 3, 2016, ground water users holding consumptive water rights bearing priority dates junior to February 8, 1989, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 44,200 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 44,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user.

Dated this 19th day of April 2016.

GARY SPACKMAN
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Attorneys for A&B Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **A&B IRRIGATION DISTRICT'S PETITION FOR RECONSIDERATION AND REQUEST FOR HEARING RE: APRIL 2016 AS APPLIED ORDER**

COMES NOW, A&B Irrigation District (hereafter referred to as "A&B" or "District"), by and through counsel of record, and hereby requests reconsideration and a hearing on the Director's *Final Order Regarding April 2016 Forecast Supply (Methodology Steps 1-3)* ("*April Order*") issued on April 19, 2016. The petition is filed pursuant to Idaho Code § 67-5246, Idaho Code § 42-1701A(3), and the Department's rules of procedure (IDAPA 37.01.740.02).

BACKGROUND

The Director issued the *April Order* implementing Steps 1 - 3 of the SWC conjunctive administration methodology on April 19, 2016. The Director predicted in-season material injury to TFCC in the amount of 44,200 acre-feet. The Director identified A&B's "proportionate share" of the predicted injury to be "3,463 acre-feet." *April Order* at 5, n. 4. No explanation is given in the order regarding the method and calculation of the "proportionate share." IDWR later published "background data" on its website concerning the apportioned shortfall between junior priority ground water rights subject to the order.[1] The data includes various modeling files and maps. In addition, IDWR included an excel spreadsheet that depicts the "predicted impact of ABID junior use" as "7.8%." No further explanation of the method or calculation is given.

PETITION FOR RECONSIDERATION

A&B requests reconsideration of the Director's calculation that A&B's "proportionate share of the predicted DS of 44,200 acre-feet is 3,463 acre-feet." *April Order* at 2016. A&B is unclear as to the basis for the Director's method and calculation to determine the "proportionate impact" of A&B's ground water rights junior to February 8, 1989 as compared to other junior ground water rights. A&B does not understand how IDWR arrived at the "7.8%" number.

A&B should only be responsible for the predicted injury caused by its junior priority ground water rights subject to the *April Order* on the Near Blackfoot to Minidoka reaches of the Snake River. A&B has five "enlargement" water rights affected by the *April Order* that authorize the irrigation of 2,063.1 acres (water right nos. 36-15127B, 36-15193B, 36-15194B, 36-15195B, and 36-15196B). Even using ESPAM 2.1's average annual crop irrigation requirement of 2.46 af assigned to the A&B area, irrigation of the acres by the junior rights would equal an annual depletion of 5,075 acre-feet. The "proportionate share" identified by the

[1] *See* http://www.idwr.idaho.gov/News/WaterCalls/Surface%20Coalition%20Call/

Director would equal about 68% of the total estimated depletion. A&B does not believe the impact of its junior rights equals 68% of their total annual use, or 3,463 acre-feet on the Near Blackfoot to Minidoka reaches. *See e.g. March 29, 2016 Post Audit Memo (Rangen Call) (Jennifer Sukow)* (showing simulated impact of A&B conversion projects of 1,377 acres on Near Blackfoot to Minidoka reach to be approximately 34%). Moreover, in connection with A&B's mitigation plan for the Rangen Call Brockway Engineering modeled the total depletion for the enlargement water rights as 4,340 acre-feet (2.1 afa). The predicted impact on the Near Blackfoot to Minidoka reaches was estimated as 1,791 acre-feet, or approximately 41% of the total depletion. Using that percentage A&B should only be responsible to mitigate for 2,115 acre-feet (even assuming that IDWR's number of 2.46 afa and 5,075 af is correct).

Consequently, A&B requests the Director to re-calculate the "proportionate impact" based upon the predicted impact of A&B's ground water rights junior to February 8, 1989 on the Near Blackfoot to Minidoka reaches of the Snake River.

Finally, the Director failed to consider the impacts caused by hydraulically connected junior ground water rights tributary to the Snake River but that are not within the defined "area of common ground water supply." Rule 50. Irrespective of the rule, the Director has the duty and obligation to use the best available science in water right administration, which he acknowledges is ESPAM 2.1. *See April Order* at 5, n. 3. ESPAM 2.1 defines the Eastern Snake Plain Aquifer differently than the CM Rules, which was promulgated over 20 years ago. *See* CM Rule 50.01. The rule admittedly fails to account for the best available science to the detriment of junior ground water users like A&B.[2] By excluding certain juniors from administration the Director has artificially enlarged the mitigation obligation of A&B contrary to Idaho's

[2] The Director attempted to repeal Rule 50 during the last legislative session. Although the Legislature rejected the Director's proposed rule change that does not excuse unconstitutional water right administration. Even the Legislature cannot override what the constitution requires.

constitution and water distribution statutes. Stated another way, if all hydraulically connected juniors were being appropriately administered, A&B's "proportionate share" of the mitigation obligation would be lower. The application of the CM Rules in such a manner is unconstitutional and should be reconsidered.

REQUEST FOR HEARING

To the extent the Director denies the above request for reconsideration to identify an accurate "proportionate share" regarding A&B's junior priority ground water rights with respect to the predicted demand shortfall, including appropriately identifying all hydraulically connected junior ground water rights, A&B requests a hearing on the same pursuant to Idaho Code § 42-170A(3).

Further, in order to avoid unnecessary delay and further litigation, A&B and its consultants are available and would be willing to participate in an informal meeting with IDWR the other parties to review and better understand the Director's findings and methods used regarding this issue.

DATED this 2nd day of May, 2016.

Travis L. Thompson

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**CM-DC-2010-001** **ORDER ON PETITION FOR RECONSIDERATION AND REQUEST FOR HEARING**

BACKGROUND

On April 19, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC").[1]

On April 19, 2016, the Director issued the *Final Order Regarding April Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"), which applied steps 1, 2, and 3 of the Methodology Order. The Director predicted an in-season demand shortfall ("DS") of 44,200 acre-feet. *As-Applied Order* at 3-4. The Director ordered that, by May 3, 2016, ground water users with consumptive water rights "junior to February 8, 1989, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 44,200 acre-feet in accordance with an approved mitigation plan." *Id.* at 6. The Director noted that A&B Irrigation District ("A&B") has an approved mitigation plan in place for its ground water rights (filed in Docket No. CM-MP-2015-003) and determined that A&B's "proportionate share of the predicted DS of 44,200 acre-feet is 3,463 acre-feet." *Id.* at 5, n.4.

On May 2, 2016, A&B submitted to the Department *A&B Irrigation District's Petition for Reconsideration and Request for Hearing Re: April 2016 As Applied Order* ("Petition"). On May 9, 2016, the City of Pocatello ("Pocatello") submitted *Pocatello's Response to A&B's Motion for Reconsideration* ("Response").

[1] The SWC is comprised of A&B District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company.

ANALYSIS

1. A&B's Proportionate Share Should be Adjusted.

A&B asserts the Director miscalculated A&B's proportionate share of the predicted DS and requests the Director "recalculate the 'proportionate impact' based upon the predicted impact of A&B's ground water rights junior to February 8, 1989 on the Near Blackfoot to Minidoka reaches of the Snake River." *Petition* at 2-3.

A&B's proportionate share of the predicted DS of 44,200 acre-feet was miscalculated. In the As-Applied Order, the Director estimated that A&B's proportionate share is 3,463 acre-feet. The calculation of this volume was based on the incorrect assumption that A&B's approved mitigation plan mitigates for all ground water irrigation diversions within A&B's place of use boundary. However, A&B's mitigation plan only mitigates for specific diversions authorized by ground water rights held by A&B (nos. 36-2080, 36-15192, 36-16749, 36-15127A, 36-15193A, 36-15194A, 36-15195A, 36-15196A, 36-15127B, 36-15193B, 36-15194B, 36-15195B, and 36-15196B). A number of other irrigation water rights are appurtenant to lands located within A&B's district boundaries, but are owned by other water right holders. Because of the inclusion of these other water rights, the As-Applied Order's A&B mitigation obligation of 3,463 acre-feet was calculated based on curtailment of 3,419 acres, which was excessive. As A&B asserts in the Petition, A&B's junior water rights affected by the As-Applied Order only authorize irrigation of 2,063.1 acres. *Petition* at 2.

The Director recalculated the obligation assuming curtailment of only the 2,063.1 acres authorized by junior water rights held by A&B. In ESPAM2.1, the Director applied a stress equal to the average crop irrigation requirement for 2,063.1 acres and distributed the stress among the 184 points of diversion for A&B's junior water rights. The average annual crop irrigation requirement, based on data from the last ten years of the ESPAM2.1 model calibration period (November 1998 through October 2008), was 2.48 acre-feet/acre.[2] Based on the revised analysis, A&B's proportionate share of the predicted DS should be 2,122 acre-feet.[3]

2. The Director will Grant A&B's Request for Hearing on the Scope of Junior-Priority Ground Water Rights That Should be Subject to Administration.

A&B asserts that the Director erroneously excluded "certain juniors from administration" and, therefore, "artificially enlarged the mitigation obligation of A&B contrary to Idaho's constitution and water distribution statutes." *Petition* at 3-4. Specifically, A&B asserts "the Director failed to consider the impacts caused by hydraulically connected junior ground water rights tributary to the Snake River but that are not within" the area of common ground water supply defined by Rule 50 of the Department's Rules for Conjunctive Management of Surface

[2] While A&B notes that Brockway Engineering previously modeled A&B's impact using an annual crop irrigation requirement of 2.1 acre-feet/acre, this value is lower than the ESPAM2.1 data used to calculate the February 8, 1989, priority date for the As-Applied Order. The Director will use the ESPAM2.1 data for the analysis of A&B's impact to be consistent with the calculation of impact for all junior ground water users.

[3] Supporting files for the Department's revised analysis are posted at: http://www.idwr.idaho.gov/News/WaterCalls/Surface%20Coalition%20Call/.

and Ground Water Resources, IDAPA 37.03.11 *et seq.* ("CM Rules"). *Id.* at 3. A&B notes that ESPAM 2.1 defines the Eastern Snake Plain Aquifer differently than the CM Rules and asserts that CM Rule 50 "fails to account for the best available science to the detriment of junior ground water users like A&B." *Id.* A&B asserts that, "if all hydraulically connected juniors were being appropriately administered," A&B's proportionate share of the predicted DS would be lower and that "application of the CM Rules in such a manner is unconstitutional and should be reconsidered." *Id.* at 4. A&B requests a hearing on this issue pursuant to Idaho Code § 1701A(3).

Pocatello argues the Director should reject A&B's argument "that the Director should have evaluated injury without regard to the area of common ground water identified in Rule 50 to reduce A&B's proportional obligation to satisfy SWC's injury amount." *Response* at 2. Pocatello states the Department "is not authorized to disregard lawfully enacted and maintained [CM Rules] in administering delivery calls." *Id.*

Idaho Code § 42-1701A(3) states: "Unless the right to a hearing before the director . . . is otherwise provided by statute, any person aggrieved by any action of the director . . . and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action." The Director will grant A&B's request for a hearing because the law creates the right to a hearing. A threshold issue is whether the Director can and should determine the constitutionality of a rule establishing an area of common ground water supply.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED that:

1) A&B's request for re-calculation of its proportionate share of the predicted DS set forth in the As-Applied Order is GRANTED. A&B's proportionate share of the predicted DS is 2,122 acre-feet, not 3,463 acre-feet.

2) A&B's request for hearing on the issue of the scope of junior-priority ground water rights that should be subject to administration in response to the SWC delivery call is GRANTED. The granting of this hearing does not stay the effectiveness of the Methodology Order or As-Applied Order. The Director will shortly issue a subsequent order scheduling a pre-hearing conference.

Dated this 11th day of May 2016.

GARY SPACKMAN
Director

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**CM-DC-2010-001** **FINAL ORDER CURTAILING NON-ENLARGEMENT GROUND WATER RIGHTS JUNIOR TO APRIL 12, 1994, AND ENLARGEMENT GROUND WATER RIGHTS JUNIOR TO MARCH 14, 1971**

The Director of the Idaho Department of Water Resources ("Department") finds, concludes, and orders as follows:

FINDINGS OF FACT

1. On April 19, 2016, the Director issued the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC").[1]

2. On April 11, 2019, the Director issued the *Final Order Regarding April 2019 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"), which applied steps 1, 2, and 3 of the Methodology Order. The Director predicted an in-season demand shortfall ("DS") of 20,900 acre-feet. *As-Applied Order* at 3-4. The Director ordered that, by May 1, 2019, ground water users with consumptive water rights "junior to August 25, 1991, within the Eastern Snake Plain Aquifer area of common ground water supply ("ESPA ACGWS") shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 20,900 acre-feet in accordance with an approved mitigation plan." *Id.* at 6. The Director also ordered that, if such a junior ground water user cannot establish they can mitigate for their proportionate share of the predicted DS "in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user." *Id.*

3. On May 22, 2019, the Director received the Water District 01 Water Report ("Water Report"). The Water Report stated that the Twin Falls Canal Company ("TFCC") leased 5,049.9 acre-feet to the Supplemental Pool according to Water District 01's Rental Pool

[1] The SWC is comprised of A&B Irrigation District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company.

Procedure 8.2.a.[2]

4. There are currently six approved mitigation plans in place responding to the SWC delivery call:

(1) Docket No. CM-MP-2009-007 for the benefit of the Idaho Ground Water Appropriators, Inc. ("IGWA") (delivery of stored water);

(2) Docket No. CM-MP-2009-006 for the benefit of IGWA (conversions, dry ups and recharge);

(3) Docket No. CM-MP-2016-001 for the benefit of IGWA (the IGWA and SWC stipulated mitigation plan);

(4) Docket No. CM-MP-2010-001 for the benefit of the Southwest Irrigation District and Goose Creek Irrigation District (collectively, "SWID");

(5) Docket No. CM-MP-2019-001 for the benefit of certain cities commonly referred to as the "Coalition of Cities"; and

(6) Docket No. CM-MP-2015-003 for the benefit of the A&B Irrigation District ("A&B").

5. In the 2019 As-Applied Order, the Director found that due to the nature of the approved mitigation plans for SWID, IGWA and the Coalition of Cities, these entities do not need to establish they can mitigate for their proportionate share of the predicted DS. *See As-Applied Order* at 5, note 4. However, the Director concluded that A&B must mitigate for its proportionate share of the predicted DS of 20,900 acre-feet and determined that A&B's proportionate share is 2,121 acre-feet. *Id.*

6. On April 23, 2019, A&B filed with the Department *A&B Irrigation District's Petition for Reconsideration and Request for Hearing Re: April 2019 As Applied Order*[,] *Notice of Non-use* ("Petition"). In its Petition, A&B requests reconsideration of the Director's determination that A&B's "'proportionate share of the predicted DS of 20,900 acre-feet is 2,121 acre-feet.'" *Petition* at 2 quoting *As Applied Order* at 5, note 4. A&B also requests a hearing regarding the Director's determination of A&B's proportionate share of the predicted DS. *Id* at 3. A&B also provides "notice of non-use of its junior ground water rights subject to the [As-Applied Order] for the 2019 irrigation season." *Id.* at 4.

7. On May 1, 2019, the Coalition of Cities submitted a *Notice of Participation in Cities' Mitigation Plan* to the Department, identifying ground water users participating in the Coalition of Cities mitigation plan for 2019.

8. On May 14, 2019, the Director issued an *Order Granting Request for Hearing* in response to A&B's Petition. Granting the request for hearing does not stay the effectiveness of

[2] The 2019 Water District 01 Rental Pool Procedures can be viewed here: http://www.waterdistrict1.com/rental%20pool%20rules.pdf

the Methodology Order, the As-Applied Order, nor this *Final Order Curtailing Non-Enlargement Ground Water Rights Junior to April 12, 1994, and Enlargement Ground Water Rights Junior to March 14, 1971. Order Granting Request for Hearing* at 2. The *Order Granting Request for Hearing* also states the Director will address A&B's statements of non-use in this order. *Id.*

CONCLUSIONS OF LAW

1. Idaho Code § 42-602 authorizes the Director to supervise water distribution within water districts:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

2. As explained above, by May 1, 2019, ground water users with consumptive water rights "junior to August 25, 1991, within the Eastern Snake Plain Aquifer area of common ground water supply" had to "establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 20,900 acre-feet in accordance with an approved mitigation plan." *As-Applied Order* at 6. If a junior ground water user does not establish that they can mitigate for their proportionate share of the predicted DS "in accordance with an approved mitigation plan" the ground water user will be subject to this "order curtailing the junior-priority ground water user." *Id.*

Based on the Water Report discussed above, the Director should decrease the forecasted DS by 5,049.9 acre-feet, the amount TFCC rented to the Supplemental Pool. The Methodology Order states "water supplied to private leases or to the rental pool by a SWC member will be included as a part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation." Methodology Order at 13; *see also* IDAPA 37.03.11.42.01.g and *American Falls Reservoir Dist. No. 2 v. Idaho Dept. of Water Resources*, 143 Idaho 862, 880, 154 P.3d 433, 451 (2007). Furthermore, when an SWC member leases storage water into the rental pool following a determination of a demand shortfall for that SWC member and the storage water is rented, the rental pool lease in/rental out of storage water is per se evidence that the senior water right holder does not need the water. Therefore, the revised predicted DS is 15,850.1 acre-feet and the revised priority cutoff date is April 12, 1994, for non-enlargement water rights and March 14, 1971, for enlargement water rights. [3]

[3] The As Applied Order determined A&B's proportionate share of the predicted DS or 20,900 acre-feet was 2,121 acre-feet. This *Final Order Curtailing Non-Enlargement Ground Water Rights Junior to April 12, 1994, and Enlargement Ground Water Rights Junior to March 14, 1971's* reduction of the demand shortfall from 20,900 acre-

3. Due to the nature of the approved mitigation plans for SWID, IGWA and the Coalition of Cities, these entities do not need to establish that they can mitigate for their proportionate share of the predicted DS. Junior ground water users entitled to the protection of the SWID, IGWA and Coalition of Cities mitigation plans will not be subject to curtailment during the 2019 irrigation season.

4. As discussed above, A&B's Petition notified the Director that it "will not deliver groundwater pursuant to its referenced ground water rights subject to the [As-Applied Order] this irrigation season. Consistent with the Director's June 30, 2016 letter concerning this same issue, A&B presumes that the referenced water rights will be removed from the curtailment list as A&B will not deliver groundwater pursuant to these rights this irrigation season." Petition at 4. In 2016, A&B similarly stated that it would voluntarily curtail its enlargement water rights but then exercised its enlargement water rights. *Final Order Denying A&B Irrigation District's Petition for Reconsideration* at 2 (Dec. 20, 2016).

5. To ensure that A&B's enlargement water rights are curtailed for 2019, the Director will place the enlargement water rights on the curtailment list. The Director will instruct the Watermaster to confirm that A&B is not diverting ground water pursuant to its enlargement water rights. A&B will not have a mitigation obligation for this year if A&B curtails the enlargement ground water rights and if the priority date for curtailment for 2019 remains junior to A&B's other ground water rights.

6. Consistent with the As-Applied Order, the Director will order curtailment of junior-priority ground water users that have not established they can mitigate for their proportionate share of the predicted DS in accordance with an approved mitigation plan. Junior-priority ground water users subject to curtailment are listed in Attachment A to this order.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED that, at 12:01 a.m. on or before June 21, 2019, ground water users holding water rights bearing priority dates junior to April 12, 1994 and enlargement water rights bearing priority dates junior to March 14, 1971, within the ESPA ACGWS listed in Attachment A to this order shall curtail/refrain from diversion and use of ground water pursuant to those water rights unless notified by the Department that the order of curtailment has been modified or rescinded as to their water rights. This order shall apply to consumptive ground water rights, including but not limited to, agricultural, commercial, industrial, and municipal uses. This order excludes ground water rights used for *de minimis* domestic purposes where such domestic use is within the limits of the definition set forth in Idaho Code § 42-111 and ground water rights used for *de minimis* stock watering where such stock watering use is within the limits of the definitions set forth in Idaho Code § 42-1401A(11), pursuant to IDAPA 37.03.11.020.11.

---

feet to 15,580 acre-feet results in a reduction to A&B's proportionate share of the demand shortfall to 1,945 acre-feet.

IT IS FURTHER ORDERED that watermasters for the water districts within the ESPA ACGWS who regulate ground water are directed to review the water rights listed in Attachment A to this order and subject to curtailment and begin contacting the water right holders in their respective districts to evaluate and determine how the water rights will be curtailed.

IT IS FURTHER ORDERED that holders of ground water rights affected by this order may participate in an approved mitigation plan through a ground water district and shall have fifteen days from the issuance of this order to join, solely for mitigation purposes, the ground water district situated nearest the lands to which the water rights are appurtenant. *See* H.B. No. 737 (*Act Relating to the Administration of Ground Water Rights Within the Eastern Snake River Plain*, ch. 356, 2006, *Idaho Sess. Laws* 1089) and Idaho Code § 42-5259. Holders of ground water rights affected by this order may also submit a proposed mitigation plan to the Director in accordance with CM Rule 43. *See* IDAPA 37.03.11.043. Upon receipt of a proposed mitigation plan, the Director will publish notice of the proposed mitigation plan for two successive weeks, after which ten days will be allowed for the filing of protests. The Director will then hold a hearing as necessary to determine whether a proposed mitigation plan will mitigate injury to the SWC caused by the ground water rights at issue. If holders of ground water rights affected by this order do not participate in an approved mitigation plan by June 21, 2019, the Director will curtail the junior priority ground water use.

Dated this 7th day of June 2019.

GARY SPACKMAN
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Revised July 1, 2010

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**CM-DC-2010-001** **ORDER REVISING APRIL 2021 FORECAST SUPPLY** ***(METHODOLOGY STEP 6)***

The Director ("Director") of the Idaho Department of Water Resources ("Department") finds, concludes, and orders as follows:

FINDINGS OF FACT

A. Background

1. On April 19, 2016, the Director issued his *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies Step 6 of the Methodology Order.

2. Step 6 states:

> Approximately halfway through the irrigation season, but following the events described in Step 5, the Director will, for each member of the SWC: (1) recalculate RISD [Reasonable In-Season Demand]; (2) issue a revised FS [Forecast Supply]; and (3) estimate the Time of Need date.

Methodology Order at 37 (internal footnote omitted).

3. On April 19, 2021, the Director issued his *Final Order Regarding April 2021 Forecast Supply (Methodology Steps 1 – 3)* ("April Forecast Supply Order"). The April Forecast Supply Order predicted a demand shortfall to the SWC of 40,500 acre-feet for the 2021 irrigation season. *April Forecast Supply Order* at 3. At that time, the only member of the SWC predicted to experience material injury during the 2021 irrigation season was the Twin Falls Canal Company ("TFCC"). The Director ordered that, by May 1, 2021, ground water users with consumptive water rights "junior to May 30, 1989, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 40,500 acre-feet in

accordance with an approved mitigation plan." *Id.* at 6. The Director also ordered that, if a junior ground water user cannot establish they can mitigate for their proportionate share of the predicted demand shortfall in accordance with an approved mitigation plan, "the Director will issue an order curtailing the junior-priority ground water user." *Id.*

4. On May 20, 2021, the Director issued a *Final Order Curtailing Ground Water Rights Junior to May 30, 1989* ("Curtailment Order"). The Director ordered that:

> [A]t 12:01 a.m. on or before June 3, 20[21], ground water users holding water rights bearing priority dates junior to May 30, 1989, within the [Eastern Snake Plain Aquifer area of common ground water supply] listed in Attachment A to this order shall curtail/refrain from diversion and use of ground water pursuant to those water rights unless notified by the Department that the order of curtailment has been modified or rescinded as to their water rights.

Curtailment Order at 3-4.

B. April – June Climate

5. The April 2021 Joint Forecast prepared by the United States Army Corps of Engineers and the United States Bureau of Reclamation ("BOR") predicted 2,600,000 acre-feet of natural flow at the Heise gage for the period April – July, 2021. *April Forecast Supply Order* at 2. The Joint Forecast "is generally as accurate a forecast as is possible given current data gathering and forecasting techniques." *Methodology Order* at 17.

6. The months of April, May, and June were dry. According to data measured at the Natural Resources Conservation Service's SNOTEL sites in the Upper Snake River Basin, the basin received 49%, 121%, and 13% of average precipitation in April, May, and June, respectively. The National Weather Service's Twin Falls weather station reported 29%, 51%, and 2% of normal precipitation in April, May and June, respectively. Twin Falls temperatures were 0.3 degrees below normal for April, were 0.1 degrees above normal for May, and were 8.4 degrees above normal for June.[1]

C. Reasonable In-Season Demand

7. RISD is the volume of water that would be required to be diverted at the point of diversion during the year of evaluation to grow the specific crops within the service area of the entity. In April, the demand from the 2006/2008/2012 baseline year ("BLY") represents the RISD. During the irrigation season, the RISD for the already expired portion of the irrigation season is recalculated by dividing the actual crop water need ("CWN") for each entity by the project efficiency for that entity. For the future remainder of the irrigation season, the RISD is the demand predicted from the July-October 06/08/12 BLY. RISD is calculated on a monthly timestep.

---

[1] Precipitation and temperature data obtained from the NOAA National Weather Service Preliminary Monthly Climate Data for the Twin Falls 3SE weather station (Twin Falls Airport).

i. Crop Water Need

8. CWN is the project wide volume of irrigation water required for crop growth so crop development is not limited by water availability. CWN is the difference between the fully realized consumptive use associated with crop development, or evapotranspiration, and effective precipitation. CWN is an input variable for calculating RISD for those months of the irrigation season that are complete. Actual RISD for the completed portion of the irrigation season is combined with monthly predicted baseline demands for the remaining months of the irrigation season to calculate a season-total RISD volume. Demand shortfall is then calculated as the difference between the adjusted forecast supply and the RISD. For specifics regarding determination of CWN, see *Methodology Order* at 14.

9. As calculated from the beginning of the irrigation season (April 1), the SWC's volumetric CWN for the current water year through the month of June is 631,436 acre-feet. This volume is 127% of the April 1 – June 30 ten-year average CWN (2011-2020) and 120% of the CWN for the (2006/2008/2012) BLY. As calculated from April 1 to June 30, from the year 2000 until this year, 2021 has the largest CWN volume of any irrigation season. The following graphs summarize monthly volumetric CWN values.

ii. Extension of BLY

10. The RISD for the future portion of the irrigation season (July –October) is the July-October demand for (2006/2008/2012) BLY. The numeric July-October demand values are shown in the table in Finding of Fact 11 below.

iii. Calculation of RISD

11. As calculated from the beginning of the irrigation season (April 1), the SWC's volumetric RISD for 2021 through June 30 is 1,731,575 acre-feet. This volume is 129% of the April 1 – June 30 ten-year average RISD (2011-2020) and 132% of the April-June demand for the (2006/2008/2012) BLY. As calculated from April 1 to June 30, from the year 2000 until this year, 2021 has the largest RISD volume of any irrigation season. The recalculated RISD on June 30 of the 2021 irrigation season by entity is summarized in column six of the following table:

	April-June CWN (AF)	E_p (April - June)	April-June RISD (AF)	July-October Demand for 06/08/12 BLY (AF)	Recalculated RISD (AF)
A&B	19,056	0.45-0.96	31,790	36,114	67,904
AFRD2	70,170	0.21-0.37	234,532	261,740	496,272
BID	53,223	0.31-0.47	130,653	136,738	267,390
Milner	14,636	0.35-0.90	29,302	28,352	57,654
Minidoka	100,661	0.36-0.56	213,368	200,690	414,058
NSCC	156,076	0.22-0.39	525,648	584,862	1,110,510
TFCC	217,614	0.29-0.50	566,343	633,715	1,200,058

D. Forecast Supply

12. When determined during the irrigation season, the forecast supply ("FS") is the sum of the actual natural flow supply from April through June, the predicted natural flow supply from July through October, and the actual storage allocations. *Methodology Order* at 37. Actual natural flow diversions for the already expired portion of the irrigation season are extracted from the Department's water rights accounting program. The natural flow diversions for the remainder of the irrigation season are estimated by a regression analysis. *Id.* at 18, 37. Storage allocations are established by the BOR and Water District 01 ("WD1") on the day of allocation. *Id.* at 37.

i. Sum of Actual Natural Flow Diverted

13. Actual natural flow diverted for the period April through June for each SWC member are summarized in the table contained within the Summary of Forecast Supply section in Finding of Fact 21.

ii. Regression Models to Predict Natural Flow (July – October)

14. Natural flow diversions were predicted for the remainder of the irrigation season by regression analysis. The Methodology Order established the following variables as predictor variables in the regression models: natural flow in the Snake River near Heise as reported by the BOR, snow water equivalent ("SWE") data from the Two Ocean Plateau SNOTEL site, Spring Creek discharge, and select ground water levels near American Falls Reservoir. *Methodology Order* at 19. Unique regression models with unique predictor variable groups are established in the Methodology Order for each SWC member.

15. Either June 15 or July 1 SWE values for the Two Ocean Plateau SNOTEL site are used as input variables in each of the regression models developed in the Methodology Order. Two Ocean Plateau SWE data was selected as a predictor variable in the Methodology Order based upon step-wise statistical analysis carried out in the development of each regression model. The Two Ocean Plateau SWE data is an optimum predictor variable for several reasons including: its elevation (the site is located above 9,000 ft and typically still has snow late in the runoff season (June 15 and July 1); its location (the site is in the headwaters of the Snake River above Jackson Reservoir); and its period of record, which is sufficiently long enough to support model development.

16. On July 1, 2021, the Two Ocean Plateau SNOTEL station reported 0.2 inches of SWE and this value was used to predict July – October natural flow volumes for A&B, AFRD2, and Milner.

17. The variables used to predict July – October natural flow volumes for BID, Minidoka, and NSCC in 2021 include: (1) 0.0 inches of SWE reported by the Two Ocean Plateau SNOTEL site on June 15, 2021; (2) 1,841,633 acre-feet of natural flow runoff at the Snake River near Heise (April – June) as reported by the BOR; and (3) 26.25 feet depth to water at well 5S31E27ABA1 as measured by IDWR on March 23, 2021.

18. The variables used to predict the July – October natural flow volume for TFCC in 2021 include: (1) 0.0 inches of the SWE reported by the Two Ocean Plateau SNOTEL Site on June 15; (2) 1,841,633 acre-feet of natural flow runoff at the Snake River near Heise (April – June) as reported by the BOR; and (3) 80,118 acre-feet of discharge (January – May) as measured and reported by the United States Geologic Survey for its *Spring Creek at Sheepskin Rd Nr Fort Hall ID* Gage (Gage No. 13075983).

iii. Storage Allocations

19. Preliminary storage allocation values for each member of the SWC were established by the BOR and WD1 and published in WD1's Initial Storage Report on June 29, 2021,[2] found in the table in Finding of Fact 21 below.

iv. Adjustments to Total Supply

20. The natural flow and storage water supplies were both adjusted as shown in the table in Finding of Fact 21 below. Adjustments to natural flow include wheeled water to Southwest Irrigation District through BID and Milner, 3,700 acre-feet and 3,000 acre-feet, respectively. The only adjustments made to the stored water supply in the table below were for the Minidoka Credit. Adjustments for wheeled storage water published in WD1's weekly reports were not included as an adjustment because wheeled water does not actually increase the amount of water available for use by the SWC. Water supplied to or from the rental pool was not included in the adjustments. An adjustment for water supplied to or from the rental pool would artificially increase or decrease the shortfall obligation.

v. Summary of Forecast Supply

21. The table below contains the individual components of the FS for each of the SWC members.

	Natural Flow Diverted 4/1 to 6/30 (AF)	Predicted Natural Diversions Flow 7/1 to 10/31 (AF)	Natural Flow Adjustment (AF)	Preliminary Storage Allocation (AF)	Minidoka Credit Adjustment (AF)	Forecast Supply (AF)
A&B	2,868	0	0	132,913		135,781
AFRD2	57,259	2,864	0	382,492	1,000	443,616
BID	113,750	4,178	(3,700)	220,123	5,130	339,482
Milner	11,124	835	(3,000)	83,050		92,009
Minidoka	108,748	5,620	0	314,318	8,370	437,056
NSCC	279,202	44,560	0	834,679	(7,750)	1,150,691
TFCC	457,025	394,532	0	237,962	(6,750)	1,082,769

[2] The *Initial Storage Report* may be viewed at: http://www.waterdistrict1.com/WD01%20Storage%20Report.pdf.

E. Revised Shortfall Prediction

22. Demand Shortfall ("DS") is calculated as the difference between RISD and the FS.

23. Based on the above, and as summarized in the table below, the Director predicts, at this time, that TFCC and AFRD2 are expected to experience material injury.

	Forecast Supply (AF)	RISD (AF)	Shortfall (AF)
A&B	135,781	67,904	0
AFRD2	443,616	496,272	52,700
BID	339,482	267,390	0
Milner	92,009	57,654	0
Minidoka	437,056	414,058	0
NSCC	1,150,691	1,110,510	0
TFCC	1,082,769	1,200,058	117,300
		Total	170,000

24. The current, predicted shortfall to the SWC's RISD is 170,000 acre-feet.

25. The estimated Time of Need was established by predicting when the remaining storage balance for TFCC was equal to their reasonable carryover volume of 25,200 acre-feet and the remaining storage balance for AFRD2 was equal to their reasonable carryover volume of 11,500 AF. An analogous year was chosen to predict the storage use for TFCC and AFRD2 for the remainder of this season. The analogous year, 2013, was selected based on similar Blackfoot to Milner reach gains. Anticipating that TFCC's and AFRD2's storage use for the remainder of the 2021 season will be similar to their storage use in 2013, the Time of Need is predicted to occur on August 20, 2021, for TFCC and September 25, 2021 for AFRD2.

F. Step 6

26. Step 6 requires the following:

> Upon a determination of an additional mitigation obligation, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to secure a volume of storage water pursuant to an approved mitigation plan or to conduct other approved mitigation activities that will deliver the additional mitigation obligation water to the injured members of the SWC at the Time of Need. If junior ground water users fail or refuse to submit this information within fourteen (14) days from issuance of a Step 6 order, the Director will issue an order curtailing junior ground water users. The ESPA Model will be run to determine the priority date to produce the

necessary mitigation obligation volume within the area of common ground water supply, as described by CM Rule 50.01.

Methodology Order at 38 (footnote omitted).

27. The predicted July DS for TFCC is 117,300 acre-feet. The predicted shortfall to AFRD2 is 52,700 acre-feet.

28. The Department ran the Eastern Snake Plain Aquifer Model ("ESPAM") version 2.1 to predict the junior priority water rights that must be curtailed to produce the volume of water equal to the predicted July DS. Ground water rights bearing priority dates junior to June 14, 1977, must be curtailed to produce the volume of water equal to the predicted July DS.

CONCLUSIONS OF LAW

29. Idaho Code § 42-602 authorizes the Director to supervise water distribution within water districts:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

30. Idaho Code § 42-607 states the watermaster, under the direction of the Director, shall regulate diversions "when in times of scarcity of water it is necessary so to do in order to supply the prior rights of others in such stream or water supply . . . ."

31. Based on Findings of Fact 5 through 25 above, it is reasonably certain TFCC and AFRD2 will be materially injured. The predicted shortfall to TFCC is 117,300 acre-feet. The predicted shortfall to AFRD2 is 52,700 acre-feet.

32. In the April Forecast Supply Order, the Director predicted a demand shortfall to the SWC of 40,500 acre-feet. Because the Step 6 revised mid-season prediction is greater than the shortfall predicted in the April Forecast Supply Order, the curtailment date established in the Curtailment Order must be adjusted.

33. Using the ESPAM 2.1, the new curtailment date is junior to June 14, 1977.

34. The predicted July DS is 170,000 acre-feet. Junior ground water users holding consumption water rights bearing priority dates junior to June 14, 1977, within the Eastern Snake

Plain Aquifer area of common ground water supply must mitigate for their proportionate share of the predicted DS in accordance with an approved mitigation plan.[3] Junior ground water users mitigating for their proportionate share of the predicted DS with a secured volume of water pursuant to an approved mitigation plan must, to the satisfaction of the Director, secure their proportionate share for delivery to the injured members of the SWC on or before August 3, 2021.

35. If, on or before August 3, 2021, ground water users holding consumptive water rights bearing priority dates junior to June 14, 1977, within the Eastern Snake Plain Aquifer area of common ground water supply fail to establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 170,000 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user. Junior ground water users who are mitigating with a secure volume of water are not required to assign the secured volume of water until after the Director issues a subsequent order requiring assignment of the water.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED as follows:

The Director's revised prediction is an in-season DS of 170,000 acre-feet. On or before August 3, 2021, ground water users holding consumptive water rights bearing priority dates junior to June 14, 1977, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 170,000 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director that they can mitigate for their proportionate share of the predicted DS of 170,000 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user.

[3] There are six approved mitigation plans in place responding to the SWC delivery call filed by: 1) A&B Irrigation District, 2) Southwest Irrigation District and Goose Creek Irrigation District (collectively, "SWID"), 3) the Idaho Ground Water Appropriators, Inc. ("IGWA"), and 4) certain cities commonly referred to as the "Coalition of Cities." A&B's enlargement rights have already been curtailed by the May 20, 2021, Curtailment Order, which remains in effect. A&B's other water rights are not affected by the adjusted curtailment date, thus A&B does not need to establish that it can mitigate for its proportionate share of the predicted DS in this order. SWID, IGWA and the Coalition of Cities, do not need to establish that they can mitigate for their proportionate share of the predicted DS either due to the nature of their respective mitigation plans.

IT IS FURTHER ORDERED the May 20, 2021, Curtailment Order remains in full force and effect. All ground water users holding water rights listed in Attachment A to the May 20, 2021, Curtailment Order bearing priority dates junior to May 30, 1989, shall continue to be curtailed from diversion and use of ground water pursuant to those water rights unless they are mitigating in accordance with an approved mitigation plan or are notified by the Department that the order of curtailment has been modified or rescinded as to their water rights.

Dated this 20th day of July, 2021.

GARY SPACKMAN
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Revised July 1, 2010

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **FINAL ORDER ESTABLISHING 2022 REASONABLE CARRYOVER** ***(METHODOLOGY STEP 9)***

FINDINGS OF FACT

1. On April 19, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established 9 steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies step 9, the final step of the Methodology Order for the 2022 water year.

2. The Methodology Order describes step 9 as follows:

> Step 9: Following the end of the irrigation season (on or before November 30), the Department will determine the total actual volumetric demand and total actual [crop water need] for the entire irrigation season. This information will be used for the analysis of reasonable carryover shortfall, selection of future [base line year], and for the refinement and continuing improvement of the method for future use.
>
> On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of SWC. These estimates will be based on, but not limited to, the consideration of the best available water diversion and storage data from Water District 01, return flow monitoring, comparative years, and [reasonable in-season demand]. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover shortfall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights.

Methodology Order at 38–39.

3. There are currently seven approved mitigation plans in place responding to the SWC delivery call to mitigate for material injury to in-season demand and reasonable carryover:

1) Docket No. CM-MP-2009-007 for the benefit of the Idaho Ground Water Appropriators, Inc. ("IGWA") (delivery of stored water);

2) Docket No. CM-MP-2009-006 for the benefit of IGWA (conversions, dry ups, and recharge);

3) Docket No. CM-MP-2016-001 for the benefit of IGWA (the IGWA and SWC stipulated mitigation plan);

4) Docket No. CM-MP-2010-001 for the benefit of the Southwest Irrigation and Goose Creek Irrigation District (collectively, "SWID");

5) Docket No. CM-MP-2019-001 for the benefit of certain cities commonly referred to as the "Coalition of Cities";

6) Docket No. CM-MP-2015-003 for the benefit of the A&B Irrigation District ("A&B"); and

7) Docket No. CM-MP-2007-001 for the benefit of J.R. Simplot Company, Basic American Foods, and ConAgra Foods Packaged Foods Company, Inc., d/b/a Lamb-Weston (collectively, the "Water Mitigation Coalition") (delivery of stored water).

4. The following table summarizes the 2022 irrigation season diversions and crop water need, and reasonable in-season demand ("RISD") volumes for each SWC entity. RISD is calculated for each SWC entity using demand, crop water need, and project efficiency. *Methodology Order* at 16. All values are reported in acre-feet ("AF"). These values are used to determine entity-specific season ending reasonable in-season demand ("RISD") values.

Entity	Demand[1]	Crop Water Need
A&B	63,848	35,762
AFRD2	408,710	160,162
BID	241,033	103,327
Milner	56,452	31,908
Minidoka	311,795	188,016
NSCC	953,998	375,458
TFCC	957,044	472,011

5. The following table summarizes the final calculated 2022 in-season demand shortfall values in AF, if any, for each member of the SWC. The values in this table are different from those in the *Final Order Regarding April 2022 Forecast Supply (Methodology Steps 1–3)* (April 20, 2022) ("April Forecast Supply Order") and *Order Revising April 2022 Forecast Supply and Amending Curtailment Order (Methodology Steps 5 & 6)* (July 20, 2022) ("July Order"). The Director predicted a 162,600 AF material injury to the SWC in the April Forecast Supply Order. *April Forecast Supply Order* at 4. The Director predicted a 52,600 AF material injury to the SWC in the July Order. *July Order* at 8. The differences are due to changes in total supply and

[1] The "Demand" for each SWC entity is equal to each entity's 2022 April – October diversions.

RISD that reflect diversion and ET data not available at the time the April Forecast Supply Order and July Order were issued. The second column of the summary table contains the total natural flow diversions from April 1 to October 31 for each SWC member.[2] The third column summarizes the natural flow adjustments, which include natural flow delivered for recharge[3] and natural flow delivered to SWID.[4] The fourth column contains the preliminary storage allocations reported from WD01.[5] The fifth column summarizes storage adjustments due to application of the Minidoka Credit.[6] The sixth column contains the total supply available to each SWC member and is calculated by summing columns two through five. The seventh column contains the calculated RISD. The demand shortfall in the last column is calculated by subtracting the RISD from the total supply. The demand shortfall is zero when the total supply is greater than the RISD. Completed application of the methodology order results in a final net in-season demand shortfall volume of 84,200 AF to AFRD2 and 192,400 AF to TFCC for the 2022 irrigation season.[7]

Entity	Natural Flow Diverted through 10/31	Natural Flow Adjustment	Preliminary Storage Allocation	In-Season Storage Adjustment	Total Supply	RISD	Demand Shortfall
A&B	0	-	106,072	-	106,072	60,832	-
AFRD2	40,893	(2,464)	338,245	1,000	377,673	461,831	84,200
BID	86,261	(3,714)	202,293	5,130	289,970	243,232	-
Milner	9,717	(3,011)	63,046	-	69,752	62,186	-
Minidoka	111,676	-	251,632	8,370	371,678	354,496	-
NSCC	354,800	(10,368)	762,791	(7,750)	1,099,473	1,059,783	-
TFCC	755,866	(5,346)	220,395	(6,750)	964,165	1,156,558	192,400

[2] The natural flow diverted was calculated from the preliminary daily water right accounting records located here: https://www.waterdistrict1.com/media/yszp4lj1/snkwra.pdf.

[3] Natural flow recharge values represent accomplished recharge through the Idaho Water Resource Board's recharge water rights as of October 31, 2022.

[4] *See* column titled "Natural Flow Adjustment" in Attachment A to this order for further information regarding these adjustments.

[5] The preliminary storage allocations can be found on Water District 01's website located here: https://www.waterdistrict1.com/media/5vaf2jtc/2022.pdf

[6] *See* column titled "In-Season Storage Adjustment" in Attachment A to this order. The Minidoka Credit is a long-standing exchange of stored water among AFRD2, BID, MID, NSCC, and TFCC that has been incorporated into an agreement of those entities and accepted by the SRBA district court.

[7] *The Order Revising 2022 Forecast Supply (Methodology Steps 7–8)* (August 18, 2022) ("Step 7–8 Order") revised the total shortfall prediction to 132,100 AF and established the times of need. *Step 7–8 Order* at 10–11. The Step 7–8 Order demand shortfall was mitigated by junior ground water users through implementation of approved mitigation plans cited in Finding of Fact 3, or by curtailment of water use authorized by junior-priority water rights during the 2022 irrigation season not protected by an approved mitigation plan. No additional mitigation is required to address in-season demand shortfall for the 2022 irrigation season.

6. The following table summarizes the end of season reasonable carryover shortfall calculation for 2022. All values are reported in AF. The second column of the summary table contains the carryover volumes reported from the October 31, 2022 Water District 01 water rights accounting report.[8] The third column summarizes the water supplied to each SWC member for mitigation. Adjusting the October 31, 2022 carryover volumes by deducting storage water delivered to SWC members for mitigation ensures that junior ground water users not participating in approved mitigation plans do not benefit from implementation of those mitigation plans. The fourth column summarizes adjustments for storage water leased by a SWC member to the rental pool via a private lease. The adjustments for storage water leased by a SWC member ensure that the leases, which are voluntary reductions in storage supplies, do not increase the reasonable carryover shortfall obligation of junior ground water users. The fifth column contains the actual carryover volumes as defined by the Methodology Order (*Methodology Order* at 28) and is calculated by summing columns two, three, and four. The sixth column contains the reasonable carryover volumes established in the Methodology Order. *Methodology Order* at 28. The reasonable carryover shortfall in the last column is the difference between reasonable carryover and the actual carryover volume for each member of the SWC at the end of the irrigation season. Completed application of the Methodology determines a final net shortfall to AFRD2's reasonable carryover of 38,255 AF and a final net shortfall to TFCC's reasonable carryover of 11,054 AF. No other members of the SWC have a reasonable carryover shortfall.

Entity[9]	Oct. 31, 2022, Carryover	Adjustments for Mitigation	Adjustments for Storage Water Leased	Actual Carryover	Reasonable Carryover	Reasonable Carryover Shortfall
A&B	54,982	(9,703)	-	45,279	18,500	0
AFRD2	10	(26,765)	-	(26,755)	11,500	38,255
BID	51,583	(4,388)	-	47,196	0	0
Milner	28,424	(2,598)	-	25,826	4,800	0
Minidoka	66,727	(14,157)	30,000	82,569	0	0
NSCC	171,637	(14,216)	-	157,142	65,500	0
TFCC	31,125	(16,979)	-	14,146	25,200	11,054

7. The above determinations are based on water diversion and storage data from Water District 01. Although these preliminary numbers are subject to revision by Water District 01 during final accounting for 2022, revisions will not become available until after issuance of this order. For this reason, these estimates establish the final obligation of junior ground water users

[8] The preliminary water right accounting report for the 2022 irrigation season was published to the Water District 01 webpage on November 18, 2022: https://www.waterdistrict1.com/media/yszp4lj1/snkwra.pdf

The carryover volumes used in this order can be found in the report's summary Diversion table under the "AF RMNG" columns for October 31, 2022. The "AF RMNG" for Minidoka and BID were summed and then prorated 56.4% to Minidoka and 43.6% to BID. Because final accounting for 2022 is not yet complete for Water District 01, the proportions were estimated using an average of the previous five years. The October 31, 2022 "AF RMNG" for AFRD2 was corrected to address an accounting error that indicated additional storage use after irrigation shut off.

[9] Details of adjustments to quantities in the above tables are set forth in Attachment A to this order.

in supplying water to the SWC for reasonable carryover shortfall. The above determination of reasonable carryover shortfall is carried forward from the Methodology Order and accounts for the best available water diversion and storage data, comparative water years, and RISD. *Methodology Order* at 38–39.

CONCLUSIONS OF LAW

1. The Methodology Order states that, on or before November 30, the Director will estimate the SWC's reasonable carryover shortfall, if any, for 2022. *Methodology Order* at 38–39 (Step 9). If a reasonable carryover shortfall is established, junior-priority ground water users shall have fourteen days to demonstrate, to the satisfaction of the Director, "their ability to provide a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC." *Id.* at 39.

2. The evidentiary standard to apply in conjunctive administration of hydraulically connected water rights is clear and convincing. *A&B Irr. Dist. v. Idaho Dep't of Water Res.*, 153 Idaho 500, 524, 284 P.3d 225, 249 (2012).

3. "Clear and convincing evidence refers to a degree of proof greater than a mere preponderance." *Idaho State Bar v. Topp*, 129 Idaho 414, 416, 925 P.2d 1113, 1115 (1996) (internal quotations removed). "Clear and convincing evidence is generally understood to be '[e]vidence indicating that the thing to be proved is highly probable or reasonably certain.'" *State v. Kimball*, 145 Idaho 542, 546, 181 P.3d 468, 472 (2008) citing *In re Adoption of Doe*, 143 Idaho 188, 191, 141 P.3d 1057, 1060 (2006); *see also Idaho Dep't of Health & Welfare v. Doe*, 150 Idaho 36, 41, 244 P.3d 180, 185 (2010).

4. Consistent with Finding of Fact 6, the Director concludes by clear and convincing evidence there is a 38,255 AF volume of material injury to AFRD2's reasonable carryover and a 11,054 AF volume of material injury to TFCC's reasonable carryover. No other members of the SWC have a reasonable carryover shortfall.

5. Because not all junior ground water users are participants in an approved mitigation plan, the Director must determine a priority date for curtailment that will result in an accumulation of water at steady state, to the reaches of the Snake River from which the SWC members divert, in amount equal to the established reasonable carryover shortfall. Using the Eastern Snake Plain Aquifer Model ("ESPAM") Version 2.2, the Director determines the curtailment date to produce a steady state volume of at least 49,309 AF in the near Blackfoot to Minidoka reach is junior to May 31, 1989.

6. According to the Methodology Order, fourteen days following issuance of this order, which establishes the reasonable carryover shortfall obligation, junior ground water users must "establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC."

Methodology Order at 39. Otherwise, "the Director will issue an order curtailing junior ground water rights." *Id.*

ORDER

Based upon the foregoing, IT IS HEREBY ORDERED that, junior ground water users holding consumptive ground water rights within the Eastern Snake Plain Aquifer area of common ground water supply bearing priority dates junior to May 31, 1989, must mitigate for their proportionate share of the reasonable carryover shortfall of 49,309 AF in accordance with an approved mitigation plan.[10] If, within fourteen days following issuance of this order, junior ground water users fail to establish, to the satisfaction of the Director, their ability to mitigate for their proportionate share of the reasonable carryover shortfall of 49,309 AF in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water use.

IT IS FURTHER ORDERED that this final order concludes the application of the Methodology Order to the climatic, hydrologic, and agronomic facts of the 2022 irrigation season.

Dated this 30th day of November 2022.

GARY SPACKMAN
Director

[10] As stated, in Finding of Fact 3 above, seven mitigation plans are currently approved for the SWC delivery call to mitigate for material injury to reasonable carryover. Participants in the mitigation plans approved for IGWA, SWID, the Cities, and Water Mitigation Coalition do not need to establish their ability to mitigate for their proportionate share of the reasonable carryover shortfall. However, due to the nature of A&B's mitigation plan, A&B must establish to the satisfaction of the Director its ability to mitigate for its proportionate share of the reasonable carryover shortfall, which is 2,542 AF.

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 30th day of November 2022, I served a true and correct copy of the foregoing, *Final Order Establishing 2022 Reasonable Carryover (Methodology Step 9)*, by the method indicated below, upon the following:

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **FINAL ORDER REGARDING APRIL 2023 FORECAST SUPPLY** **(METHODOLOGY STEPS 1–3)**

FINDINGS OF FACT

1. On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies steps 1, 2, and 3 of the Methodology Order.

A. Step 1

2. By April 1 of each year, Step 1 requires members of the SWC to submit to the Department electronic shapefiles delineating the total anticipated irrigated acres for the upcoming year "or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent." *Methodology Order* ¶ 1 at 39.

3. On February 6, 2023, the Department received a letter from American Falls Reservoir District #2 ("AFRD2"), stating that its total number of irrigated acres has not varied by more than five percent.

4. On March 2, 2023, Minidoka Irrigation District ("Minidoka") submitted its electronic shapefile delineating its total irrigated acres to the Department.

5. On March 10, 2023, the Department received a letter from A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), Milner Irrigation District ("Milner"), North Side Canal Company ("NSCC") and Twin Falls Canal Company ("TFCC"), stating that their total number of irrigated acres for 2023 will not vary by more than five percent from the electronic shapefiles submitted in prior years.

6. Based on the information submitted by the SWC, the Department will use the following total irrigated acres:

	Total Irrigated Acres[1]	Data Source
A&B	15,924	SRBA Partial Decree
AFRD2	62,361	SRBA Partial Decree
BID	46,035	2013 shapefile submitted by BID, reduced by Department for overlapping acres and acres outside of service area.
Milner	13,264	2010 service area shapefile, reduced by Department for overlapping acres and acres outside of service area.
Minidoka	75,093	SRBA Partial Decree
NSCC	154,067	SRBA Partial Decree
TFCC	194,732	2013 shapefile submitted by TFCC, reduced by Department for overlapping acres and acres outside of service area.

B. Step 2

7. Step 2 states that, within fourteen days of the issuance of the joint forecast prepared by the United States Bureau of Reclamation and the United States Army Corp of Engineers, the Director "will issue a final order predicting the April [Forecast Supply] for the water year for each SWC entity. The Director will compare the April [Forecast Supply] for each SWC entity to the [Baseline Demand] for each SWC entity to determine if a in-season demand shortfall ("IDS") is anticipated for the upcoming irrigation season." *Methodology Order* ¶ 3 at 40.

8. On April 7, 2023, the joint forecast ("Joint Forecast") was announced, predicting an unregulated inflow 3,700,000 acre-feet at the Snake River near Heise gage for the period of April through July. The forecasted flow volume equates to 112% percent of average.[2] The Joint Forecast "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." *Id.* ¶ 49 at 18 (citation omitted).

9. The Heise natural flow data from years 1990–2022 were data inputs for development of regression equations for A&B and Milner to predict the natural flow supply.[3] Data greater or less than two standard deviations from average were excluded from the regression development.

10. The April–July Heise natural flow data from the years 1990–2022 and Box Canyon November–March total discharge data for the period 1989–2022, were data inputs for development of multiple linear regression equations to predict the natural flow supplies for

[1] The number of irrigated acres used in this methodology order is the number of reported acres unless that number is larger than the decreed irrigated acres, and if so, then the decreed acres were used.

[2] The average is based on the years 1991-2020. The Joint Forecast relies on a "30-Year Climate Normal" to calculate an Average April through July runoff volume.

[3] Attached hereto, as Attachment A, are the regression analyses for each SWC entity used to predict natural flow supply.

AFRD2, BID, Minidoka, NSCC, and TFCC. *Methodology Order* ¶ 49 at 18. The U.S. Geological Survey measures and monitors the flow at the Box Canyon stream flow measurement gage. The Box Canyon November–March total discharge used by the Director in the regression models for 2023 totaled 91,898 acre-feet.

11. The storage allocations were predicted for each SWC member. As of April 11, 2023, preliminary water right accounting for the 2023 irrigation year had not been completed. Storage allocations were calculated using an average of actual storage allocations of analogous years. The Surface Water Supply Index (SWSI)[4], produced by the Natural Resources Conservation Service (NRCS), is calculated by summing reservoir carryover and the forecasted spring and summer streamflow runoff. The April 1 SWSI indicates the water supply in 1993 and 2016 are analogous to the water supply in 2023. Based on the analogous years, the Director anticipates SWC members will receive 95–100% of their allocation. The storage allocations are based on the anticipated allocations minus evaporation charges.

12. Based on the above, the Director projects as follows:

	Predicted Natural Flow Supply	Predicted Storage Allocation	Minidoka Credit Adjustment	Total Supply	BLY 2018	Shortfall
A&B	14,833	135,411		150,244	64,192	0
AFRD2	115,223	387,853	1,000	504,076	453,890	0
BID	109,313	221,713	5,130	336,156	262,211	0

				Total Projected Demand Shortfall (AF)		75,200

C. Step 3

13. Step 3 requires the following:

> Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April IDS unless the April IDS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the

[4] SWSI is a predictive indicator of the surface water available in a basin compared to historic supply. The SWSI is produced monthly by the Natural Resources Conservation Service (NRCS). *See* Nat. Res. Conserv'n Serv., U.S. Dep't of Agric., *Surface Water Supply Index (SWSI)*, https://www.nrcs.usda.gov/wps/portal/nrcs/detail/id/snow/waterproducts/?cid=stelprdb1240689 (last visited Apr. 20, 2022).

individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

Methodology Order ¶ 4 at 40.

14. The predicted April DS for TFCC is 75,200 acre-feet. The total predicted DS is 75,200 acre-feet.

15. The Eastern Snake Plain Aquifer Model ("ESPAM") is used to predict the junior priority water rights that must be curtailed to produce the volume of water equal to the predicted April DS in the near Blackfoot to Minidoka reach. The ESPAM is updated periodically as new field measurements and advancements in modeling technology become available. ESPAM Version 2.2 ("ESPAM2.2") is the current version. ESPAM2.2 model documentation reports (including a model calibration report, a predictive uncertainty analysis, a superposition model scenario, and a curtailment scenario) were finalized on May 27, 2021. *See* Idaho Dep't of Water Res., *ESPAM2.2 Reports* (2021), https:// research.idwr.idaho.gov/files/projects/espam/ browse/ESPAM22_Reports/.

16. The Department ran ESPAM2.2 to predict the junior priority water rights within the area of common ground water supply that must be curtailed to produce the volume of water equal to the predicted April DS between the May 1 and September 30 of this irrigation season pursuant to the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*. Ground water rights bearing priority dates later than December 30, 1953, must be curtailed to produce the volume of water equal to the predicted April DS in the near Blackfoot to Minidoka reach.

CONCLUSIONS OF LAW

1. The Fifth Judicial District Court, in and for the County of Minidoka, held that the evidentiary standard of proof to apply in conjunctive administration of hydraulically connected water rights is clear and convincing. *See* Mem. Decision & Order on Pets. for Jud. Rev., *A&B Irr. Dist., Inc. v. Idaho Dep't of Water Res.*, No. CV-2009-647 (Minidoka Cnty. Dist. Ct. Idaho May 4, 2010); Mem. Decision & Order on Pets. for Reh'g, *A&B Irr. Dist., Inc. v. Idaho Dep't of Water Res.*, No. CV-2009-647 (Minidoka Cnty. Dist. Ct. Idaho Nov. 2, 2010).

2. "Clear and convincing evidence refers to a degree of proof greater than a mere preponderance." *Idaho State Bar v. Topp*, 129 Idaho 414, 416, 925 P.2d 1113, 1115 (1996) (internal quotations removed). "Clear and convincing evidence is generally understood to be '[e]vidence indicating that the thing to be proved is highly probable or reasonably certain.'" *State v. Kimball*, 145 Idaho 542, 546, 181 P.3d 468, 472 (2008) (citing *In re Adoption of Doe*, 143 Idaho 188, 191, 141 P.3d 1057, 1060 (2006)); *see also Idaho Dep't of Health & Welfare v. Doe*, 150 Idaho 36, 41, 244 P.3d 180, 185 (2010).

3. The Director must utilize the best available technology for determining the impact of junior ground water diversions. *See Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 814,

252 P.3d 71, 95 (2011). ESPAM 1.1 and 2.1 are the model versions utilized previously in SWC delivery call proceedings. The Director determined that ESPAM 2.1 is the best available scientific tool for predicting the effects of ground water pumping. *See Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 124, 369 P.3d 897, 902 (2016). ESPAM 2.2 is the latest version of the ESPAM model. The improvements incorporated into ESPAM 2.2, as discussed in Finding of Fact 15, make it the best available scientific tool for predicting the effects of ground water pumping in this proceeding.

4. In 2023, the Director has sufficient information to quantify irrigated areas for each of the SWC members as required by Step 1.

5. The Joint Forecast predicts an unregulated inflow of 3,700,000 acre-feet at the Snake River near Heise gage for the period of April through July. The forecasted flow volume equates to 112% of average.

6. The April predicted DS is 75,200 acre-feet. Junior ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply must mitigate for their proportionate share of the predicted DS in accordance with an approved mitigation plan.[5] Junior ground water users mitigating for their proportionate share of the predicted DS with a secured volume of water pursuant to an approved mitigation plan must, to the satisfaction of the Director, secure their proportionate share for delivery to the injured members of the SWC on or before May 5, 2023. There was a reasonable carryover shortfall of 49,309 acre-feet in the fall of 2022. However, because junior ground water users did not secure any mitigation water for a carryover shortfall, there is no adjustment to the mitigation obligation.

7. If, on or before May 5 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply fail to establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user. Junior ground water users who are mitigating with a secured volume of water are not required to assign the secured volume of water until after the Director issues a subsequent order requiring assignment of the water.

---

[5] There are seven approved mitigation plans in place responding to the SWC delivery call filed by: 1) A&B Irrigation District, 2) Southwest Irrigation District and Goose Creek Irrigation District (collectively, "SWID"), 3) the Idaho Ground Water Appropriators, Inc. ("IGWA"), 4) certain cities commonly referred to as the "Coalition of Cities", and 5) certain entities commonly referred to as the "Water Mitigation Coalition." A&B Irrigation District's proportionate share of the predicted DS of 75,200 acre-feet is 458 acre-feet. Due to the nature of the mitigation plans for SWID, the Coalition of Cities and the Water Mitigation Coalition, these entities do not need to establish that they can mitigate for their proportionate share of the predicted DS. IGWA has two approved mitigation plans. If IGWA is in compliance with mitigation plan CM-MP-2016-001, IGWA does not need to establish that it can mitigate for its proportionate share of the predicted DS. If IGWA seeks to provide mitigation by delivery of storage water as approved in mitigation plan CM-MP-2009-007, IGWA's proportionate share of the predicted DS of 75,198 acre-feet is 63,645 acre-feet.

8. If, at any time prior to the Director's final determination of the April Forecast Supply, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, predicted DS determination.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED as follows:

The Director predicts an in-season DS of 75,200 acre-feet. On or before May 5, 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user.

Dated this 21st day of April 2023.

GARY SPACKMAN
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Revised July 1, 2010

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **FIFTH AMENDED FINAL ORDER REGARDING METHODOLOGY FOR DETERMINING MATERIAL INJURY TO REASONABLE IN-SEASON DEMAND AND REASONABLE CARRYOVER**

BACKGROUND

On April 19, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued his *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order"). The Fourth Methodology Order: (1) explained how the Director would determine material injury to storage and natural flow water rights of members of the Surface Water Coalition ("SWC")[1]; (2) established methods for quantifying material injury to SWC storage and natural flow water rights as predictive and actual demand shortfalls; (3) established methods for quantifying mitigation obligations by holders of junior priority ground water rights for shortfalls in predictive and actual SWC water demands; and (4) established a method for determining a priority date for curtailment if mitigation obligations are not satisfied.

The processes established in the Fourth Methodology Order for determining material injury are not carved in stone. Updates to the methodology order based on additional data and analyses were always anticipated:

> Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will review and refine the process of predicting and evaluating material injury. The methodology will be adjusted if the data supports a change.

[1] The SWC is comprised of A&B District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company. Each entity holds separate senior surface natural flow water rights and has separate storage contracts for storage water space in the reservoirs.

Fourth Methodology Order, Conclusion of Law 17; *see also In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irrigation Dist.*, 155 Idaho 640, 645, 315 P.3d 828, 833 (2013) ("[t]he concept of a baseline is that it is adjustable . . . ."). The prediction and determination of rights and obligations of the holders of senior priority and junior priority water rights respectively must: (1) apply the best available science and underlying water data; (2) consider changing climatic and cropping patterns; and (3) adhere to the most recent decisions of the courts related to water administration.

Many of the data sets the Department relied upon in the Fourth Methodology Order have been expanded and now include additional years. Furthermore, the Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling to determine a curtailment priority date that would supply adequate water to the senior water right holders. The first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling. In contrast, the current version was calibrated using monthly stress periods and half-month time steps, a refinement that facilitates in-season transient modeling for calculating the response to curtailment of groundwater use. The purpose of this *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") is to update the Director's methodology for determining material injury to storage and natural flow water rights either held by or committed to members of the SWC consistent with the Director's ongoing obligation to use the best available science and information.

FINDINGS OF FACT

I. Overview of the Methodology for Determining Material Injury to Water Rights by Determining Reasonable In-Season Demand and Reasonable Carryover

1. The methodology for determining material injury to water rights by determining reasonable in-season demand ("RISD") and reasonable carryover should be based on updated data, the best available science, analytical methods, and the Director's professional judgment as manager of the state's water resources. In the future, climate may vary and conditions may change; therefore, the methodology may need to be adjusted to consider a different baseline year or years ("BLY") or changes to other components.

2. In-season demand shortfall ("IDS") will be computed by subtracting RISD from the forecast supply ("FS"). In-season demand shortfall is computed using the following equation:

$$IDS = FS - RISD$$

3. If the FS is greater than the RISD, there is no demand shortfall. If the FS is less that the RISD, the negative difference is the demand shortfall. Initially, RISD is equal to the historic demands associated with a BLY as selected by the Director, but will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

4. Reasonable carryover shortfall will be computed by subtracting reasonable carryover from actual carryover, where reasonable carryover is defined as the difference between a baseline year demand ("BD") and projected typical dry year supply. Reasonable carryover shortfall will be computed using the following equation:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

5. If actual carryover exceeds the reasonable carryover, there is no reasonable carryover shortfall. In contrast, if reasonable carryover exceeds the actual carryover, the negative difference is the reasonable carryover shortfall.

6. The concepts underlying the selection of the BLY, determination of in-season demand shortfall, and reasonable carryover shortfall will be discussed in detail below.

II. In-Season Demand Shortfall

A. Considerations for the Selection of a Baseline Year

7. A BLY is a year or average of years when irrigation demand represents conditions that can predict need in the current year of irrigation at the start of the irrigation season. The purpose of predicting need is to estimate material injury.

8. A BLY is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) irrigation practices. R. Vol. 37 at 7098.[2] To capture current irrigation practices, identification of a BLY is limited to years subsequent to 1999. *Id*. at 7096.

9. The historic diversion volumes from the BLY and the predicted supply forecast at the start of the irrigation season are inputs to predict the initial ISD, where a demand shortfall is the difference between the BD and the FS. When the difference is a negative number, the ISD is zero. ISD increases with increases in BD, decreases in FS, or both. Assuming constant irrigation practices, crop distributions, and total irrigated acres, demand for irrigation water typically increases in years of higher temperature, higher reference evapotranspiration ("ET"), and lower precipitation. If water demand data is averaged for several years and these averages are the basis to predict demand shortfall at the start of the season, in a high-water demand year, these averages may often under-predict the demand shortfall. In a high-water demand year, under-prediction of IDS might be acceptable if the junior priority ground water right holders and the senior priority surface water right holders shared equally in the risk of water shortages. Equality in sharing the risk will not adequately protect the senior priority surface water right holder from injury. Actual demand shortfalls to a senior surface water right holder resulting from predictions at the start of the irrigation season based on average data unreasonably shifts the risk of shortage to the senior surface water right holder. Therefore, a BLY should represent a

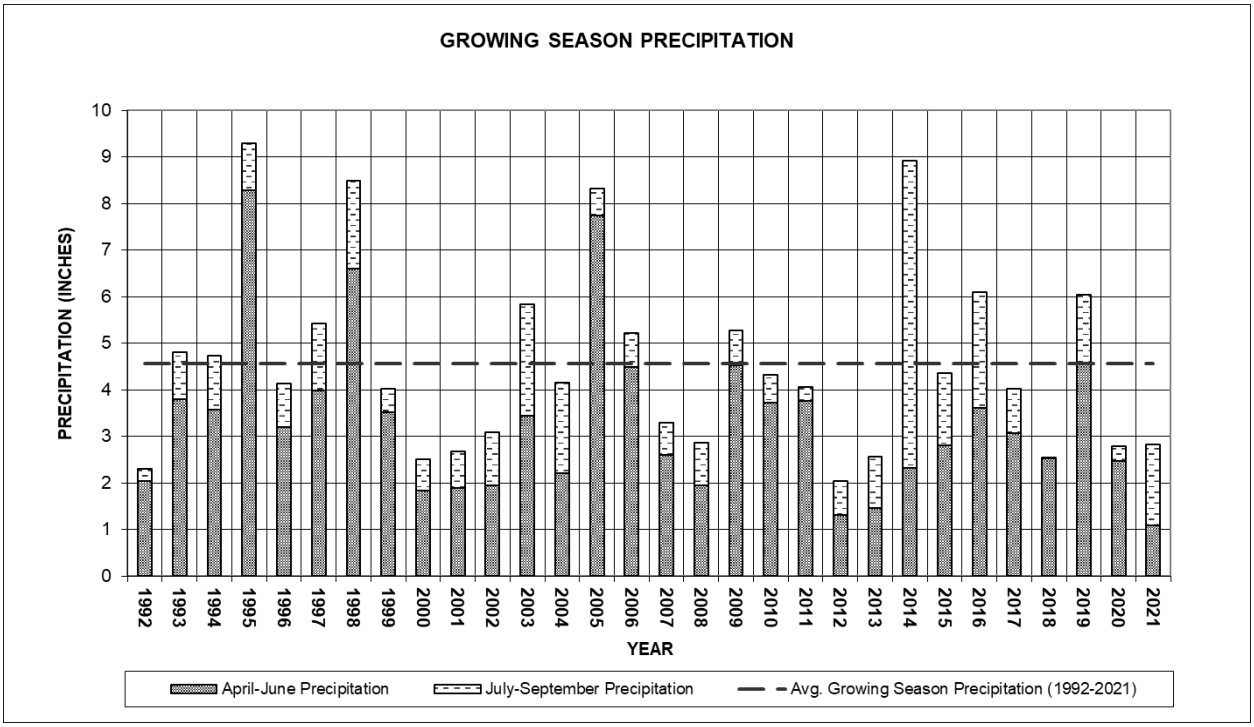
[2] All citations in this Order are to material that was admitted during the original hearing and is part of the final agency record on appeal in Gooding County Case No. CV-2008-551, which was lodged with the Fifth Judicial District Court on February 6, 2009.

year(s) of above average diversions and should not represent a year(s) of average or below average diversions. An above average diversion year(s) selected as the BLY should also represent a year(s) of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors. In addition, actual supply should be analyzed to assure that the BLY is not a year of limited supply.

i. Climate

10. For the methods outlined herein, climate is represented by precipitation, reference ET, and growing degree days.

11. Precipitation. Water, in all phases, introduced to Idaho from the atmosphere is termed precipitation. During the growing season, precipitation reduces the irrigation water needed for growing crops. Ex. 3024 at 19. The figure below shows the precipitation recorded during the growing season at the National Weather Service's Twin Falls weather station.



Growing Season Precipitation at National Weather Service's Twin Falls Weather Station 1992–2021.[3]

[3] The Fourth Methodology Order included data for the period 1990 through 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021. The chart is created from NOAA National Weather Service total precipitation data obtained from the NCDC's Climatological Data Annual Summary Idaho report series for the Twin Falls 6 E and Twin Falls Sun Valley Regional Airport weather stations.

12. Evapotranspiration. ET is a variable representing both the amount of water that transpires from vegetation and the amount of water that evaporates from the underlying soil. ET is an important factor for properly estimating RISD. In its water budget calculations, the SWC proposed the use of ET values from the USBR as part of their Pacific Northwest Cooperative Agricultural Network, i.e. AgriMet. Ex. 8000, Vol. II, Chap. 9; Ex. 8000, Vol. IV, Appdx. AU. The ground water users proposed the use of ET values from Richard G. Allen and Clarence W. Robison 2007, Evapotranspiration and Consumptive Irrigation Water Requirements for Idaho, i.e. ETIdaho. Ex. 3007A at 21; Ex. 3024 at 1-58.

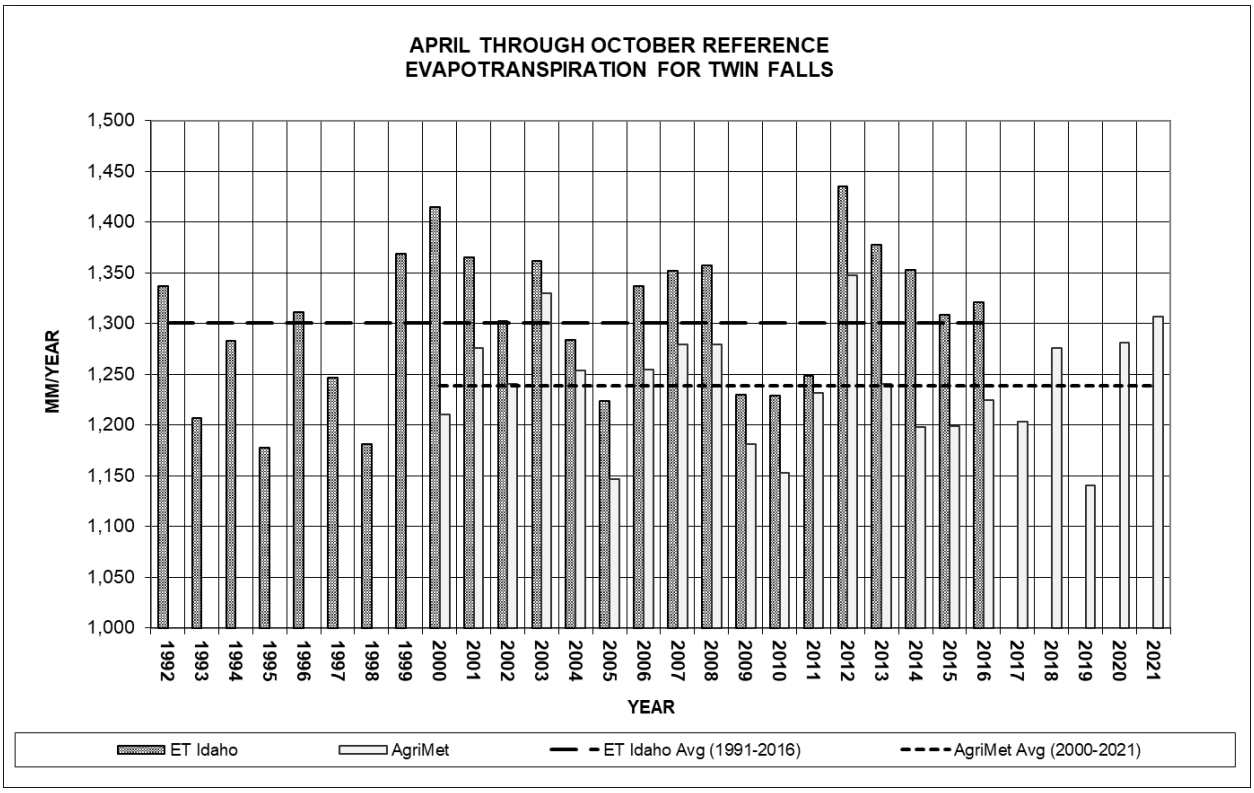
13. Reference ET is a standardized index that approximates the climatic demand for water vapor (i.e. ET). Both ETIdaho and AgriMet calculate and publish reference ET data. The Department will identify potential BLYs by consulting both ETIdaho reference ET and AgriMet reference ET.

14. Neither ETIdaho reference ET data nor AgriMet reference ET data span the entire period of analysis (1992-2021). ETIdaho reference ET data are currently available from 1990 through 2016.[4] AgriMet reference ET data are available from 2000 to 2021.[5] Ideal BLY candidates are years in which reference ET exceeds average reference ET values. The individual year is compared using both AgriMet and ETIdaho reference ET data for those years in which both data are available and only AgriMet data in those years where there is no ETIdaho data.

[4] The Fourth Methodology Order included ETIdaho reference ET data for the period 1991 to 2011. ETIdaho reference ET data is now available through 2016. This Fifth Methodology Order updates this chart with data for the period 1992 to 2016.

[5] The Fourth Methodology Order included AgriMet reference ET data for the period 2000 to 2014. . AgriMet reference ET data is now available through 2021. This Fifth Methodology Order updates this chart with data for the period 2000 to 2021.

15. Years of above average values of reference ET are appropriate BLY candidates.[6] Total April through October reference ET for the period of record from the Twin Falls (Kimberly) AgriMet site is shown below.

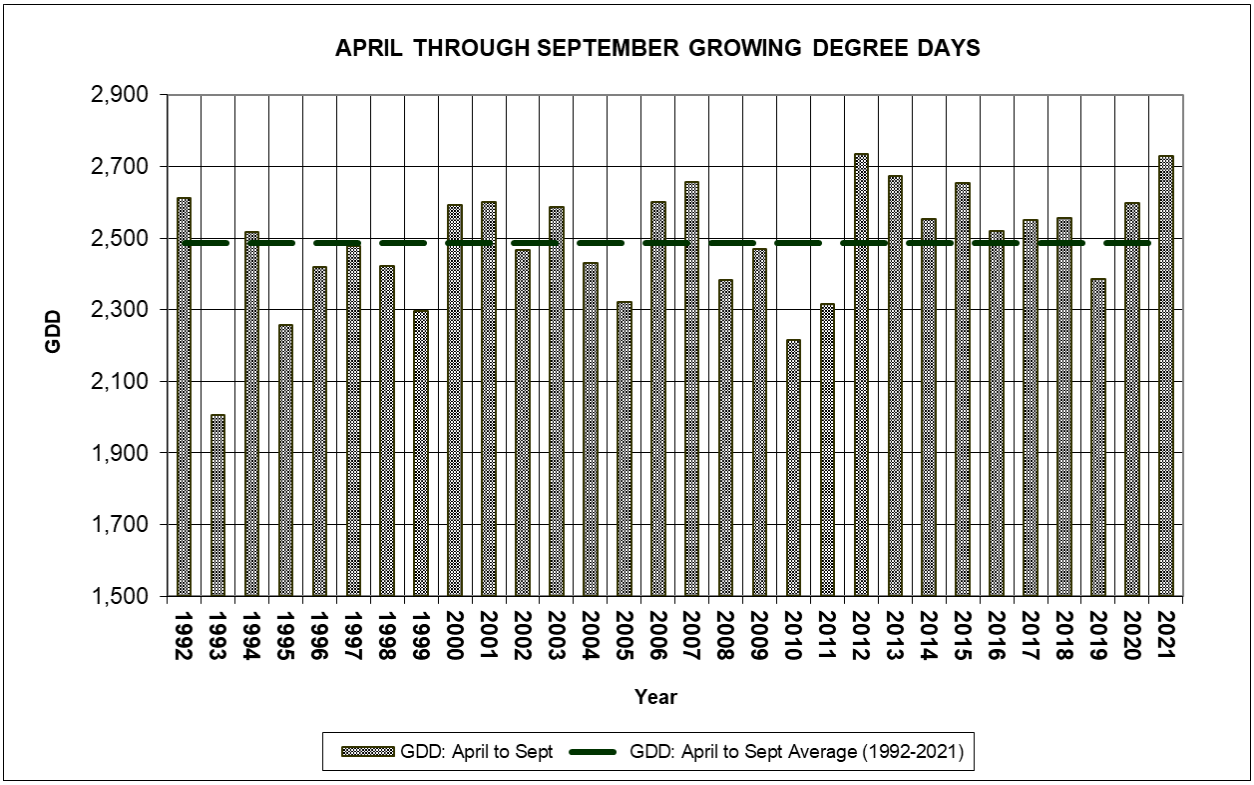


Reference ET for Twin Falls (Kimberly) with both AgriMet and ETIdaho data 1992-2021.[7]

[6] Values for reference ET between ETIdaho and AgriMet do not match because they are derived differently. The relevant information for identifying a potential BLY is the relationship between the year under consideration and the average for the data sets.

[7] The Fourth Methodology Order included data only through 2014. This Fifth Methodology Order updates this chart with combined data for the period 1992 to 2021, establishing a 30-year record which is the professional standard of practice for calculating climatic and hydrologic normals.

16. Growing Degree Days. Growing degree days define the length and type of growing season. Growing degree days are an arithmetic accumulation of daily mean temperature above a certain base temperature. Ex. 3024 at 10; 117-21. These growth units are a simple method of relating plant growth and development to air temperatures. Different plant species have different base temperatures below which they do not grow. At temperatures above this base, the amount of plant growth is approximately proportional to the amount of heat or temperature accumulated. A higher annual growing degree day value correlates to a higher potential rate of plant growth. The table below shows growing degree days accumulated for April through September for the Twin Falls (Kimberly) AgriMet site.

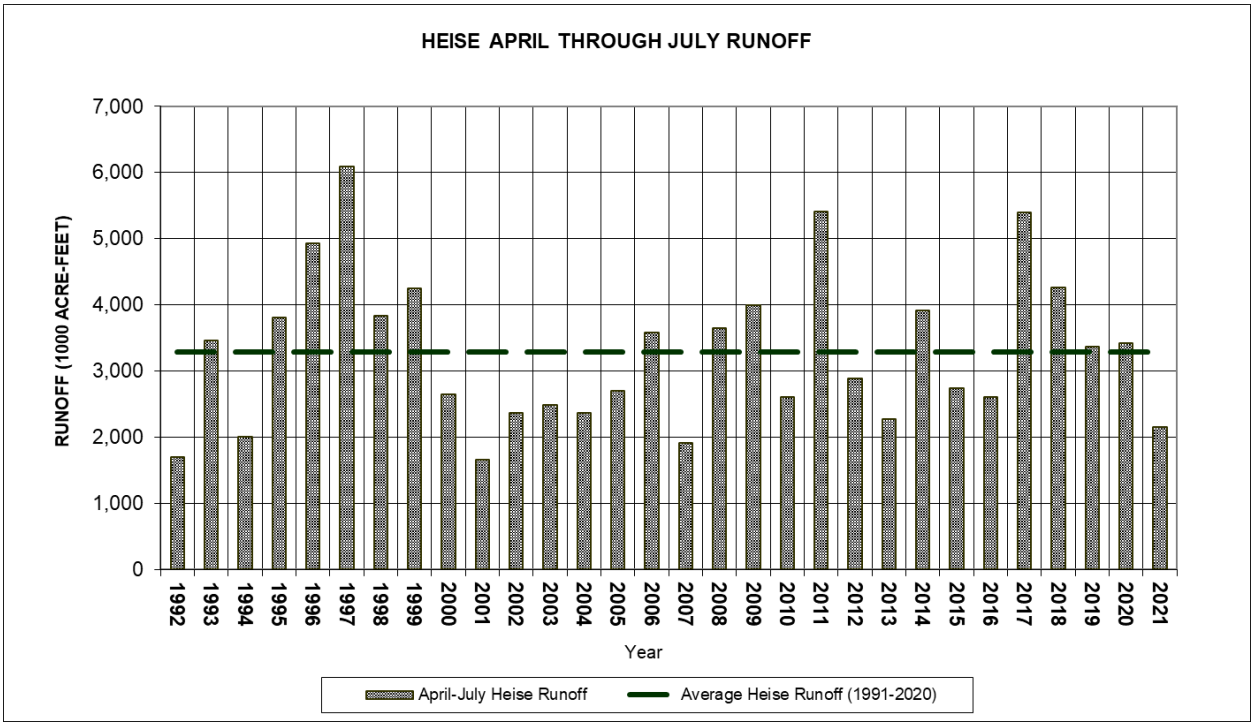


Growing Degree Days ("GDD") for Twin Falls (Kimberly) AgriMet Site 1992-2021.[8]

[8] The Fourth Methodology Order included data only through 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

ii. Available Water Supply

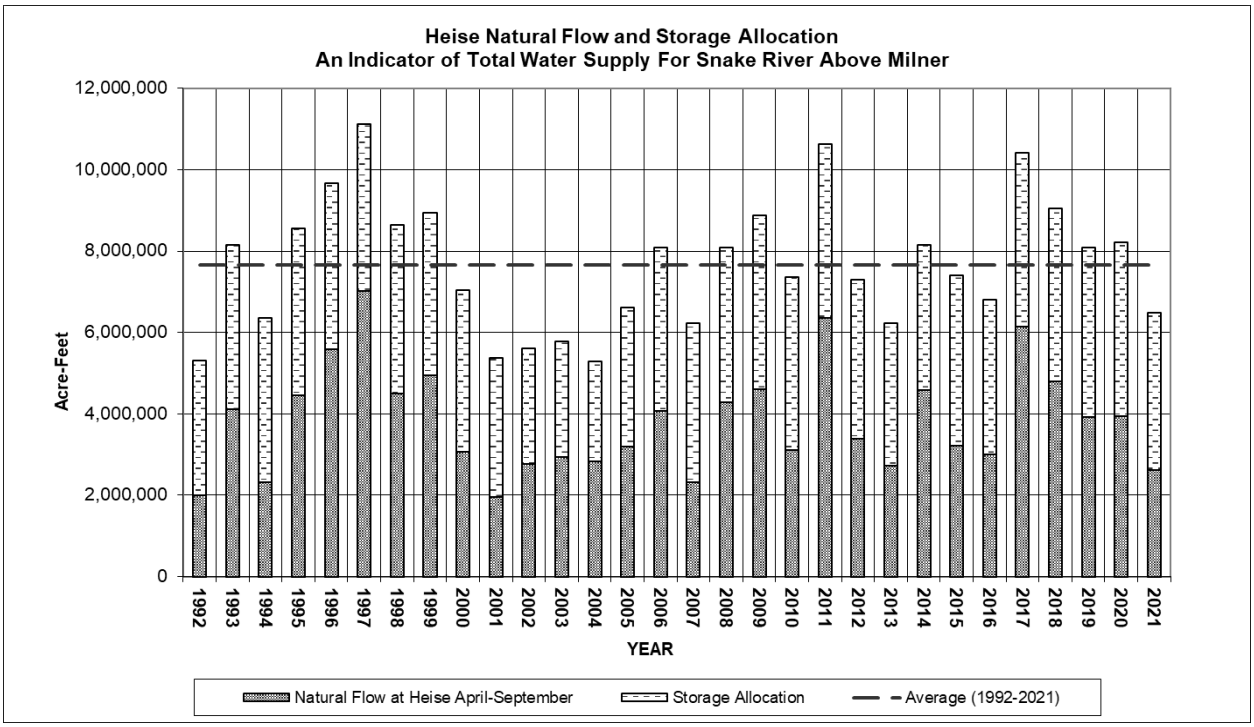
17. The April through July Heise runoff volume represents the volume of water available for diversion into storage reservoirs and is an indicator of natural flow supplies. The graph below shows actual unregulated flow volumes at Heise for 1992 through 2021. The 1992 to 2021 average (3,284,000 acre-feet) is displayed by the dashed line.



April through July Unregulated Flow Volume at Heise, 1992-2021.[9]

[9] The Fourth Methodology Order included data only through 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

18. The sum of the Heise natural flow and the reservoir storage allocations is an indicator of the total supply of the Snake River. The sum of the Heise natural flow and reservoir storage allocations for each year from 1992-2021 is represented in the graph below.



The sum of the Heise natural flow and the storage allocation for the Snake River above Milner 1992-2021.[10]

iii. Irrigation Practices

19. A baseline year ("BLY") must be recent enough to represent current irrigation practices. R. Vol. 37 at 7099-7100. Current conditions should be represented by: (a) the net area of the irrigated crops, (b) farm application methods (flood/furrow or sprinkler irrigation), and (c) the conveyance system from the river to the farm. The type of sprinkler systems should be similar between the BLY and the current year.

20. Sprinkler systems are currently the predominant application system. *Id*. at 7101-02. To ensure that current irrigation practices are captured, selection of a BLY for the SWC should be limited to years subsequent to 1999. *Id*. at 7096; 7099-7100.

[10] The Fourth Methodology Order included data for the period 1990 to 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

21. Estimates of irrigated acres from the hearing show a trend of decreasing irrigated acreage. R. Vol. 28, 5205-15; R. Vol. 37 at 7100. According to the Hearing Officer, beneficial use cannot occur on acres that have been hardened or are otherwise not irrigated. R. Vol. 37 at 7100.

22. The following table summarizes: a) SWC entities; b) shapefile source of reported irrigated acres; c) year shapefile created; d) decreed irrigated acres; (e) number of reported acres in shapefile; and f) irrigated acres used in this methodology order for the 2023 irrigation season. The number of irrigated acres used in this methodology order is the number of reported acres unless that number is larger than the decreed irrigated acres, and if so, then the decreed acres were used. This table will be updated annually based on the reported number of irrigated acres by each SWC entity in Step 1 of the Methodology Order.

Entity	Shapefile Source	Shapefile Year	Partial Decree Acres	Shapefile Acres	Acres Used in Methodology
A&B	PPU[1]	2010	15,924	21,972	15,924
AFRD2	PPU	2010	62,361	69,077	62,361
BID	SWC	2013	47,643	46,035	46,035
Milner	PPU	2010	13,335	13,264	13,264
Minidoka	SWC	2023	75,093	77,176	75,093
NSCC	PPU	2010	154,067	224,463	154,067
TFCC	SWC	2013	196,162	194,732	194,732

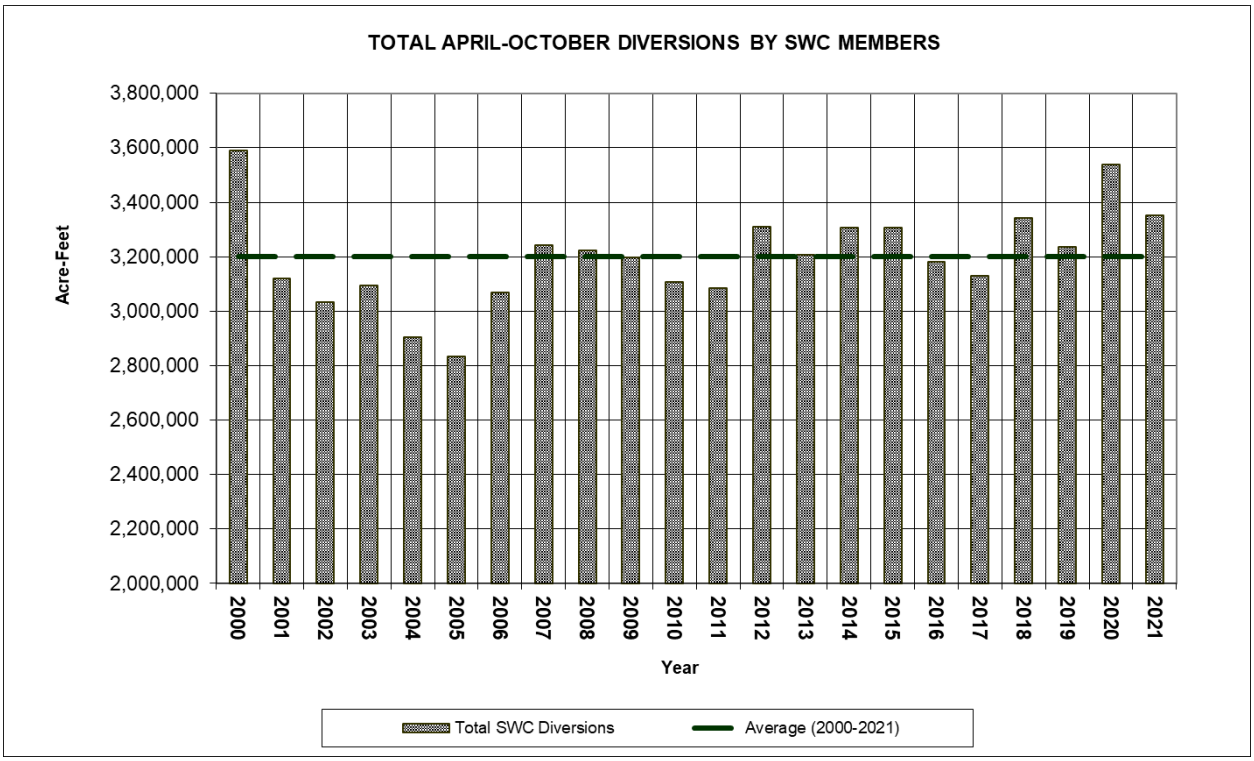
[1] IDWR permissible place of use.

Acres used in the methodology.

23. There are lands within the service areas of SWC entities that are irrigated with supplemental groundwater. Exhibit 3007. Supplemental groundwater is a factor the Director can consider in the context of a delivery call. *Memorandum Decision and Order on Petitions for Judicial Review* ("Methodology Remand Order") in Gooding County Consolidated Case No. CV-2010-382, at 18-19. At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities.

iv. Diversions

24. The following figure summarizes the annual measured diversions by the combined SWC members from 2000-2021. Diversions for a baseline year should exceed the average diversions.



Total April-October Diversions by SWC Members.[11]

B. Selection of the Initial Baseline Year

25. When selecting the BLY the Director must evaluate recent data to determine whether the BLY section criteria are satisfied.

26. In the Fourth Methodology Order, the Department considered the years 2000-2014 when deciding the BLY. Ultimately, the Department chose an average of the years 2006, 2008, and 2012 for the BLY ("BLY 06/08/12"). For this Fifth Methodology Order, the years 2000-2021 were considered for the BLY selection. With the addition of new data from 2014 to 2021, the total diversions by the SWC for the previous BLY 06/08/12 are 100% of the average SWC diversions for the years 2000-2021. As a result of adding the new data, BLY 06/08/12 no longer satisfies the presumption criteria that total diversions in the BLY should exceed the average annual diversions. Mem. Decision & Order on Pets. for Jud. Rev., at 34, *IGWA v. Idaho Dep't of Water Res.*, No. CV-2010-382 (Gooding Cnty. Dist. Ct. Idaho Sept. 26, 2014).

[11] The Fourth Methodology Order did not include this chart. It was added to demonstrate that the baseline year is a year of above average total diversions.

27. Years 2018 and 2020 satisfy all the BLY selection criteria discussed above. Each of these years had (1) total diversions above the average diversions for the years 2000-2021, (2) total growing degree days above the average for the years 1992-2021, and (3) reference ET values above the average for the years 1992-2021. The years 2018 and 2020 also had total precipitation values below the average precipitation for the years 1992-2021 and were not water supply limited years. The Department has reviewed the SWC's diversion data for the 2020 irrigation season. The Department finds that 2020 ranks as the second-highest year of total diversions for the SWC and is more than one standard deviation above the average for the years 2000-2021. In comparison, 2018 ranks as the fourth-highest year of total diversions for the SWC and is less than one standard deviation above the average for the years 2000-2021. Choosing a BLY with above average diversions but within one standard deviation, ensures that a conservative year is selected that protects the senior while excluding extreme years from consideration. The Director concludes that total diversions for 2018 adequately protect senior water rights when predicting the demand shortfall at the start of the irrigation season and selects 2018 as the BLY.

Entity	2000-2021 Avg. Total Diversions (Acre-Feet)	06/08/12 Avg. Total Diversions (Acre-Feet)	06/08/12 % of Avg.	2018 Total Diversions (Acre-Feet)	2018 % of Avg.
A&B	59,474	59,993	101%	64,192	108%
AFRD2	427,978	427,672	100%	453,890	106%
BID	247,049	251,531	102%	262,211	106%
Milner	53,343	47,135	88%	58,417	110%
Minidoka	354,181	369,492	104%	354,851	100%
NSCC	996,267	978,888	98%	1,026,661	103%
TFCC	1,062,098	1,060,011	100%	1,121,717	106%
Total	3,200,389	3,194,722	100%	3,341,939	104%

Average SWC Diversions (acre-feet) for 2000-2021, 2006/2008/2012 BLY, and 2018 BLY.

C. Calculation of Reasonable In-Season Demand

28. Reasonable in-season demand (RISD) is the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the beneficial use of growing crops within the service area of the entity. Given that climate and system operations for the year being evaluated will likely be different from the BLY, the BLY must be adjusted for those differences. As stated by the Hearing Officer, "The concept of a baseline is that it is adjustable as weather conditions or practices change, and that those adjustments will occur in an orderly, understood protocol." R. Vol. 37 at 7098.

i. Project Efficiency

29. Project efficiency ("E_p") is the ratio of total volumetric crop water needs within a SWC entity's boundary and the total volume of water diverted by that entity to satisfy its crop needs. It is the same concept as system efficiency, which was presented at hearing. Ex. 3007 at

28-29. Implicit in this relationship are the components of seepage loss (conveyance loss), on-farm application losses (deep percolation, field runoff), and system operational losses (return flows) for which data is not obtainable by the Department. By utilizing project efficiency and its input parameters of crop water need and total diversions, the influence of the unknown components for which data is not obtainable can be captured and described without quantifying each of the components. Project efficiency is derived by dividing crop water need by total diversions as depicted in the algorithm below:

$$E_p = \frac{CWN}{Q_D}$$

Where:

E_p = project efficiency,
CWN = crop water need, and
Q_D = irrigation entity diversion of water specifically put to beneficial use for the growing of crops within the irrigation entity.

30. Monthly SWC entity diversions ("Q_D") will be obtained from Water District 01's diversion records. Ex. 8000, Vol. II, at 8-4, 8-5. Raw monthly diversion values will then be adjusted to remove any water diversions that can be identified to not directly support the beneficial use of crop development within the irrigation entity. Examples of adjustments include the removal of diversions associated with in-season recharge and diversion of irrigation water on the behalf of another irrigation entity. Adjustments are unique to each SWC member and each irrigation season and will be evaluated each year. Any natural flow or storage water deliveries to entities other than the SWC for purposes unrelated to the original right will not be included as a part of the SWC water supply or carryover volume. Water that is purchased or leased by a SWC member may become part of the shortfall obligation to the extent that member has been found to have been materially injured. *See e.g.* R. Vol. 38 at 7201, n. 11 (Eighth Supplemental Order). Conversely, water supplied to private leases or to the rental pool by a SWC member will be included as a part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation.

31. Monthly project efficiencies will be computed for the entire irrigation season. Project efficiency varies from month-to-month during the season and will typically be lower during the beginning and ending of the season. Monthly project efficiencies will be divided into actual monthly crop water need ("CWN") values to determine RISD during the year of evaluation.

32. In the Fourth Methodology Order, project efficiencies for each SWC member were initially averaged over an eight-year period (2007-2014) and project efficiency greater or less than two standard deviations were excluded from the calculation. By including only those values within two standard deviations, extreme values from the data set are removed. Under the Fourth Methodology Order, an updated 8-year rolling average of project efficiencies was calculated each year the methodology was implemented. The Director now finds that averaging over a rolling period of 15 years results in project efficiency values that are more consistent from year-to-year, reducing the impact of short-term trends. The Director finds that it is still

appropriate to remove project efficiencies greater or less than two standard deviations from the average.

The following is a table of efficiency values averaged over the most recent fifteen-year period of record.

Month	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC	Monthly Avg.
4	0.98	0.33	0.45	0.87	0.43	0.24	0.31	0.51
5	0.47	0.22	0.32	0.39	0.35	0.24	0.30	0.33
6	0.66	0.40	0.49	0.60	0.56	0.41	0.51	0.52
7	0.74	0.44	0.52	0.67	0.63	0.48	0.58	0.58
8	0.58	0.41	0.42	0.55	0.52	0.43	0.46	0.48
9	0.45	0.27	0.32	0.45	0.38	0.32	0.27	0.35
10	0.18	0.16	0.09	0.14	0.11	0.06	0.04	0.11
Season Avg.	0.58	0.32	0.37	0.52	0.43	0.31	0.35	

SWC Member Average Monthly Project Efficiencies from 2007-2021.[12]

ii. Crop Water Need

33. CWN is the volume of irrigation water required for crop growth within a SWC entity boundary, such that crop growth is not limited by water availability. CWN only applies to crops irrigated with surface water. CWN is the difference between the fully realizable consumptive use associated with crop growth, or ET, and effective precipitation (W_e) and is synonymous with the terms irrigation water requirement and precipitation deficit. Ex. 3024. For the purposes of the methodology, CWN is calculated as set forth below:

$$CWN = \sum_{i=1}^{n} (ET_i - W_e) A_i$$

Where,

CWN = crop water need
ET_i = consumptive use of specific crop type,
W_e = effective precipitation,
A_i = total irrigated area of specific crop type,
i = index variable representing the different specific crop types grown within the irrigation entity, and
n = upper bound of summation equal to the total number of different specific crop types grown within the irrigation entity.

[12] In the Fourth Methodology Order, this table summarized average E_p data for the period 2007 to 2014. This Fifth Methodology Order updates this table with average E_p data for the period 2007 to 2021.

iii. Evapotranspiration

34. ET can be estimated with theoretically based equations that calculate ET for an individual crop, necessitating crop distribution maps for each year. Ex. 3007A at 21, Figure 3, Tables 6-12; Ex. 3024 at 1-58; Ex. 8000, Vol. II at Chapter 9; Ex. 8000, Vol. IV, Appdx. AU.

35. At hearing, values of ET were estimated by the SWC from AgriMet, Ex. 8000, Vol. IV, Appdx. AU-1, and by the ground water users from ETIdaho, Ex. 3007A at 21; Ex. 3024 at 1-58. At this time, the Director finds that the use of AgriMet is more appropriate for determining ET than ETIdaho because AgriMet is available to all parties in real-time without the need for advanced programming. Accordingly, the methodology will rely on AgriMet derived ET values in the calculations of project efficiency, CWN, and RISD. In the future, with the development of additional enhancements, ETIdaho may become a more appropriate analytical tool for determining ET.[13]

36. CWN is derived by multiplying crop specific ET values, adjusted for estimated effective precipitation, by the total irrigated area of individual crop types, and summing for all crop types. The areas for individual crop types will be derived from published crop distributions from the United States Department of Agriculture's National Agricultural Statistics Service ("NASS"). Ex. 1005 at 1. NASS annually creates a crop-specific land cover digital dataset from satellite imagery and field checks. The dataset is called the Cropland Data Layer ("CDL"). Each year, the Department will calculate acreage by crop type for each SWC entity using NASS CDL data. In the future, the NASS data may not be the most accurate source of data. The Department prefers to rely on data from the current season if and when it becomes usable.

37. AgriMet ET and precipitation data are gathered at the Rupert and Twin Falls (Kimberly) stations. Both stations are in the vicinity of the SWC entities. A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), and Minidoka Irrigation District ("Minidoka") are nearest to the Rupert AgriMet station. ET data gathered at the Rupert station reasonably represents the climate conditions for A&B, BID, and Minidoka. American Falls Reservoir District No. 2 ("AFRD2"), Milner Irrigation District ("Milner"), North Side Canal Company ("NSCC"), and Twin Falls Canal Company ("TFCC") are nearest to the Twin Falls (Kimberly) AgriMet station. ET data gathered at the Twin Falls (Kimberly) station reasonably represents the climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, Vol. IV at AU-2, AU-8.

iv. Effective Precipitation

38. Effective precipitation ("W_e") is the amount of total precipitation held in the soil horizon available for crop root uptake. Effective precipitation will be estimated from total precipitation (W) employing the methodology presented in the USDA Technical Bulletin 1275. Ex. 8000, Vol. IV, Appdx. AU3, AU8. Total precipitation (W) data is published by the USBR as

[13] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed alternative methods of determining ET values, such as METRIC. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet ET data.

part of its Pacific Northwest Cooperative Agricultural Network, i.e. AgriMet.[14] Ex. 8000, Vol. IV, Appdx. AU3. W_e values derived from AgriMet based precipitation values are independent of crop type.

39. AgriMet precipitation (W) values are easy to understand and regularly used by the farming, water supply, and water management communities. Accordingly, the methodology will rely on AgriMet derived W values in the calculations of CWN and RISD.

40. As with ET data, AgriMet precipitation data are available from the Rupert and Twin Falls (Kimberly) stations. AgriMet data from the Rupert station reasonably represents climate conditions for A&B, BID, and Minidoka. AgriMet data from Twin Falls (Kimberly) reasonably represents climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, Vol. IV at AU-2, AU-8.

v. Summary of Reasonable In-Season Demand Calculation

41. At the start of the irrigation season, RISD is equal to the BD, or total season adjusted diversions for the BLY. When calculated in-season, RISD is calculated below.

$$RISD_{milestonex_x} = \sum_{j=1}^{m}\left(\frac{CWN_j}{E_{p,j}}\right) + \sum_{j=m+1}^{7} BD_j$$

Where:

$RISD_{milestone_x}$ = reasonable in season demand at specified evaluation milestones during the irrigation season,
CWN = crop water need for month j,
E_p = baseline project efficiency for month j,
BD = baseline demand for month j,
j = index variable, and
m = upper bound of summation, equal to the month calculation occurs, where April = 1, May =2, … October = 7.

42. April RISD Adjustment: In April, the calculated RISD, which is the quotient of CWN and Ep, can underestimate actual canal operation diversions. Under-estimation occurs when the actual CWN value for April is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. Often, CWN in April is small due to precipitation, cool temperatures, and/or the immaturity of the crop. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in April, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. To account for the conditions affecting the

[14] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meeting, IDWR discussed alternative methods to determine W values, such as PRISM. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet precipitation data.

usability of the calculated RISD value for April, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

43. When the calculation of CWN/Ep results in a value for the month of April less than the average April diversion volume over a record of representative years in the recent past, the April RISD is set equal to the average April diversion volume. When the calculation of CWN/Ep results in a value greater than the average April diversion volume, the April RISD is equal to the calculated CWN/Ep volume.

44. October RISD Adjustment: In October, the calculated RISD, which is equal to the CWN divided by Ep, can both under-estimate and over-estimate actual canal operation diversions. The RISD may be underestimated when the actual CWN value for October is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in October, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. Furthermore, RISD may be underestimated in October when a farmer diverts water at the field head gate for farming practices other than strictly satisfying CWN. Examples of water diversion practices at the field head gate that sometimes occur in October include diverting water for soil salt leaching, diverting water to build up the soil moisture profile for the following irrigation season, and/or diverting water to wet-up bare soil to prevent wind-driven topsoil erosion.

45. Unlike the month of April, RISD can be over-estimated in October. RISD may be over-estimated in years when actual CWN in October is much greater than typical CWN over a record of representative years in the recent past due to low precipitation and/or warm temperatures. To account for the conditions affecting the usability of the RISD value calculated for October, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

46. When the calculation of CWN/Ep results in a value for the month of October greater than the maximum October diversion volume from a record of recent representative years, or less than the minimum October diversion volume from the same record of recent representative years, the October RISD is set equal to the average October diversion volume over the same period of recent representative years. When the calculation of CWN/Ep results in a value between the maximum and minimum October diversion volumes from a record of recent representative years, the October RISD is equal to the calculated CWN/Ep volume.

D. Adjustment of Forecast Supply

47. As stated by the Hearing Officer, "There must be adjustments as conditions develop if any baseline supply concept is to be used." R. Vol. 37 at 7093. A prediction of the upcoming season's supply and demand is calculated at the beginning of the irrigation season and

adjusted at specified milestones during the irrigation season to address changes in water supply and demand conditions in response to actual climatic and water supply conditions.

i. April Forecast Supply

48. The FS is comprised of natural flow and stored water.

49. Typically, within the first week of April, the USBR and the USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage from April 1 to July 31 for the forthcoming year. The joint forecast ("Joint Forecast") issued by the United States Bureau of Reclamation ("USBR") and the United States Army Corp of Engineers ("USACE") for the period April 1 through July 31 "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." R. Vol. 8 at 1379, ¶ 98. Given current forecasting techniques, the earliest the Director can predict material injury "with reasonable certainty" is soon after the Joint Forecast is issued. R. Vol. 2 at 226. With data from 1990 through the irrigation year previous to the current year, a regression equation will be developed for each SWC member.[15] The regression equations for A&B and Milner will be developed by comparing the actual Heise natural flow to the natural flow diverted. *See e.g.* R. Vol. 8 at 1416-22. For AFRD2, BID, Minidoka, NSCC, and TFCC, multi-linear regression equations will be developed by comparing the actual Snake River near Heise natural flow and the flows at Box Canyon to the natural flow diverted. The regression equations will be used to predict the natural flow diverted for the upcoming irrigation season. *Id*. at 1380. The actual natural flow volume predicted in the Director's April FS for each SWC entity will be one standard error below the regression line, which underestimates the available supply. *Id*.; Tr. p. 65, lns. 6-25; p. 66, lns. 1-2. The purpose of the shift to one standard error below the regression line is to ensure senior water right holders do not bear the risk of under-prediction of supply. The forecasting techniques will be revised based on updated data and the forecasting techniques may be revised when improvements to the forecasting tools occur.

50. The storage allocation for each member of the SWC will be estimated by the Department following issuance of the Joint Forecast. The Department will forecast reservoir fill and storage allocation consistent with the methods established in the *Fifth Supplemental Order Amending Replacement Water Requirements Final 2006 & Estimated 2007.* R. Vol. 23 at 4294-97 as explained below. The Department will evaluate the current reservoir conditions and the current water supply outlook to determine a historical analogous year or years to predict reservoir fill. The Department may identify and use a combination of different analogous years to predict individual reservoir fill. Input variables for determining the individual storage water allocation for each SWC member are: (a) the analogous year's or years' total reservoir fill volume; (b) an estimated evaporation volume; and (c) the previous year's carryover volume. The FS (the combination of the forecast of natural flow supply and the storage allocation) for each SWC member will be determined by the Director shortly after the date of the Joint Forecast.

[15] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed updating the regression models used to forecast the SWC's water supplies in April. However, the Director finds that the current models still adequately forecast water supplies in April and will continue to rely on the existing regression models.

51. Any time prior to the Director's final determination of the April FS, if the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected shortfall determination.

ii. July Forecast Supply

52. Approximately halfway through the irrigation season, the FS will be adjusted. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the year-to-date natural flow diverted by each member of the SWC. The natural flow diversion for the remainder of the irrigation season will be estimated based on the regression analyses.

53. The natural flow supplies for each SWC member are comprised of natural flow in the Snake River passing the near Blackfoot gage and gains that occur in the Snake River between the Blackfoot to Milner reach. Many different predictor variables were considered when developing the models used to predict the natural flow supplies for the remainder of the season, including those variables used in the April FS.[16] A step-wise statistical analysis was employed to help select the variables for each model. The following variables were selected to forecast water supplies halfway through the irrigation season: natural flow in the Snake River near Heise as reported by the U.S. Bureau of Reclamation; snow water equivalent (SWE) data at the Two Ocean Plateau SNOTEL site; Spring Creek discharge; and groundwater levels near American Falls Reservoir. The model predictors were optimized for each SWC member and are summarized in the sections below.

54. Linear regression equations for AFRD2, A&B, and Milner, will be developed by comparing the July 1 snow water equivalent (inches) at the Two Ocean Plateau SNOTEL site to the natural flow diversions. The regression equations for AFRD2, A&B, and Milner will be applied only in those years when the snow water equivalent at the Two Ocean Plateau SNOTEL site is greater than zero (0). Years when the snow water equivalent equals zero, the total natural flow prediction for the period July 1 to October 31 will be zero (0) AF.

55. Multiple linear regression equations for BID, Minidoka, and NSCC will be developed to predict natural flow diversions employing the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) March depth to water at well 05S 31E 27ABA1 and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

56. The multiple linear regression model for TFCC will be based on the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) Spring Creek total discharge (January – May) and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

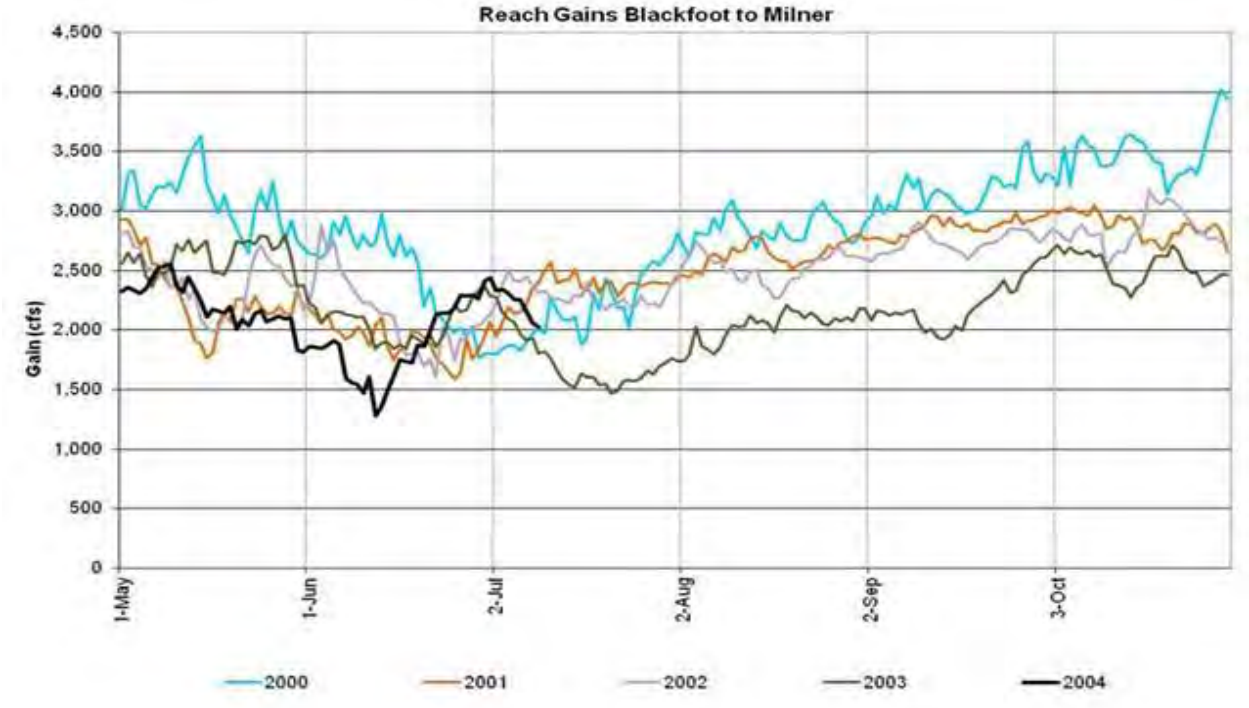
[16] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. IDWR discussed updating the regression models used to forecast the SWC's water supplies in July. However, the Director finds that the current models still adequately forecast water supplies in July and will continue to rely on the existing regression models.

57. When adjusting the storage component of the FS, the Department must consider whether stored water has been allocated. In normal to dry years, the reservoirs will typically have filled to their peak capacity for the season and the storage water will have been allocated. If the BOR and Water District 01 have allocated stored water to spaceholders, the Department will use the actual preliminary storage allocations to the SWC. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on the storage allocations from an analogous year or years.

iii. Time of Need

58. The FS will again be adjusted shortly before the Time of Need. The Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

59. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the natural flow diverted by each member of the SWC as of the new forecast date. The natural flow diversion for the remainder of the irrigation season will be estimated based on a historical year with similar reach gains in the Blackfoot to Milner reach. The following is an example of estimating reach gains from an analysis of historical years. Reach gains for the years 2000 – 2003 and a portion of year 2004 are graphed below. Considering 2004 as an example of a current year and comparing 2004 to the hydrographs for 2000 – 2003, year 2003 has similar reach gains and is appropriately conservative. Therefore, the natural flow diverted in 2003 would be used to predict the natural flow diversions for the remainder of the 2004 season.



Example Reach Gain Analysis for 2004.

60. When adjusting the storage component of the FS, the Department will use the actual preliminary storage allocations to the SWC.

61. The adjusted FS is the sum of the year-to-date natural flow diversions, the predicted natural flow diversions for the remainder of the season, and the storage allocation.

E. Calculation of In-Season Demand Shortfall

62. The equation below determines the amount of predicted demand shortfall during the irrigation season.

$$IDS = FS - RISD$$

Where:

IDS = demand shortfall for specified evaluation points throughout the season,
FS = forecasted supply adjusted for specified evaluation point during the season, and
RISD = reasonable in-season demand from above.

63. The amount calculated represents the volume that junior ground water users with approved mitigation plans for delivery of water will be required to have available for delivery to members of the SWC found to be materially injured by the Director to avoid curtailment. The amounts will be calculated in April, at the middle of the season, and at the Time of Need.

III. Methodology for Determining Material Injury to Reasonable Carryover

64. Conjunctive Management ("CM") Rule 42.01.g states the following guidance for determining reasonable carryover: "In determining a reasonable amount of carry-over storage water, the Director shall consider average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system." Carryover shortfall will be determined following the completion of the irrigation season.

A. Projected Water Supply

65. CM Rule 42.01.g states that the Director "shall consider . . . the projected water supply for the system." Because it is not possible to adequately forecast the irrigation supply or demand for the following irrigation season at the end of the current irrigation season, the Director must estimate the carryover water needed in future dry years when demand exceeds supply, creating a need for carryover storage. The Director projected the water supply using typical dry years and subtracted it from a projected future demand to determine a projected carryover need.

66. The Heise natural flow is a predictive indicator of total water supply. For the years 2002 and 2004, the Heise natural flows were well below the long term average (1992-2021), but were not the lowest years on record.[17] The average of the 2002 and 2004 supply will be the projected supply, representing a typical dry year. The 2002 and 2004 supply is computed as follows:

- 2002 supply = natural flow diverted + new storage fill
- 2004 supply = natural flow diverted + new storage fill
- Projected supply = average of 2002 supply and 2004 supply

Carryover from previous years is not included in the 2002 and 2004 new storage fill because it was not new water supplied during the 2002 or 2004 irrigation year.

	2002 Natural Flow Diverted	2002 New Storage Fill	2002 Total Supply	2004 Natural Flow Diverted	2004 New Storage Fill	2004 Total Supply	Projected Supply (Average 02/04)
	----------Acre-Feet----------						
A&B	853	45,603	46,456	1	36,535	36,536	41,496
AFRD2	25,749	381,451	407,200	4,562	309,698	314,260	360,730
BID	89,886	174,454	264,340	102,706	152,387	255,093	259,716
Milner	5,058	43,430	48,488	1,027	35,175	36,202	42,345
Minidoka	143,937	256,602	400,539	141,460	229,574	371,034	385,787
NSCC	363,960	667,799	1,031,759	315,942	479,068	795,010	913,385
TFCC	851,970	186,233	1,038,203	881,345	150,218	1,031,563	1,034,883

SWC water supplies 2002, 2004, and 2002/2004 average (acre-feet).

67. Similar to projecting supply, the Director must also project demand. Because it is not possible to adequately forecast the irrigation demand for the following irrigation season at the end of the current irrigation season, the Director must project demand. R. Vol. 37 at 7109. The 2018 BLY will be the projected demand.

[17] The Fourth Methodology Order included data for the period 1991 to 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

68. The maximum projected carryover need is defined as the difference between a BLY demand and projected typical dry year supply. The following equation computes the maximum projected carryover need:

Maximum Projected Carryover Need = Projected Demand (2018 BLY) – Projected Supply (Average 02/04)

	Projected Demand (2018 BLY)	Projected Supply (average 02/04)	Maximum Projected Carryover Need
	----------Acre-Feet----------		
A&B	64,192	41,496	22,696
AFRD2	453,890	360,730	93,160
BID	262,211	259,716	2,495
Milner	58,417	42,345	16,072
Minidoka	354,851	385,787	0
NSCC	1,026,661	913,385	113,277
TFCC	1,121,717	1,034,883	86,834

SWC Projected Demand, Projected Supply and Maximum Projected Carryover Need (acre-feet).[18]

B. Average Annual Rate of Fill

69. CM Rule 42.01.g states that the Director "shall consider the average annual rate of fill of storage reservoirs . . . ." The average annual rate of fill of the storage reservoirs is the average of annual percentages of fill of each entity's reservoir space. The average annual reservoir storage fill is a benchmark that can be compared to projected carryover need. For purposes of the table below, any water contributed to the rental pool from the previous year was added to the next year's fill volume so that it does not artificially lower the percent fill. R. Vol. 37 at 7108. Water that is supplied to the rental pool lowers carryover and could impact the following year's fill. The percent fill does not include water deducted for reservoir evaporation.

[18] This Fifth Methodology Order updates this chart with the new baseline year and calculates new maximum projected carryover need values.

The annual percent fill of storage volume by SWC entity is shown below:

Year	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
1992	96%	100%	98%	93%	75%	76%	86%
1993	100%	100%	100%	100%	100%	93%	92%

Annual Percent Fill of Storage Volume by Entity (1992-2021).[19]

[19] The Fourth Methodology Order included data from 1995 through 2014. This Fifth Methodology Order updates this chart with data from 1992 through 2021.

C. Average Annual Carryover

70. CM Rule 42.01.g states that the Director "shall consider the . . . average annual carry-over for prior comparable water conditions . . .." Actual carryover volumes are from annual storage reports published by Water District 1. Actual carryover from 1992 through 2021 are sorted into two categories – below average (dry) and above average (wet). The categories are based on Heise natural flow volumes from April through September.

The 1992 to 2021 average natural flow volume is 3,827 thousand acre-feet ("KAF").

Cat.	Year	Heise Apr–Sept (KAF)	A&B	AFRD2	BID	Milner	MID	NSCC	TFCC
			----------	----------	----------	Acre-Feet	----------	----------	----------
	2001	1,968	9,902	4,217	37,430	26,854	55,132	42,421	26,917
	1992	2,001	11,966	11,548	31,977	28,896	16,928	19,439	3,590
	1994	2,319	82,885	26,894	54,136	45,902	102,823	128,356	38,686

Actual Carryover Volumes by Entity, Sorted by Heise Natural Flow (1992-2021).[20]

[20] In the Fourth Methodology Order, this table summarized data for the period 1994 to 2014 and adjusted WD 01 carryover values to remove water received for mitigation or water rented by the SWC entity to augment their supplies. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021 and uses raw

71. In considering the principles articulated in CM Rule 42.01.g, the Director will project reasonable carryover shortfalls for members of the SWC. The following table represents the 2018 BLY diversion volumes and total reservoir storage space by entity. By dividing the total reservoir space by the 2018 diversion volume, a metric is established that describes the total number of seasons the entity's reservoir space can supply water.

	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
	----------Acre-Feet----------						
Projected Demand (2018 BLY)	64,192	453,890	262,211	58,417	354,851	1,026,661	1,121,717
Total Reservoir Space	137,626	393,550	226,487	90,591	366,554	859,898	245,930
Number of Seasons of Reservoir Space	2.1	0.9	0.9	1.6	1.0	0.8	0.2

Total Reservoir Space[21] in Comparison to Demand.[22]

D. Reasonable Carryover

i. A&B

72. A&B's reservoir space has the lowest average annual rate of fill with the highest variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that A&B's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68 & 70. A&B has an approximate two-year water supply provided by its total available storage space. *See* Finding of Fact 71. Because of its lower rate of fill, it is likely A&B will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria in CM Rule 42.01.g, A&B's reasonable carryover should be the maximum projected carryover need of 22,700 AF. *See* Finding of Fact 78.

ii. AFRD2

73. AFRD2 has the highest and most consistent reservoir rate of fill of any member of the SWC. AFRD2's storage space fills 99% of the time and has a fill variability of 3%. As

carryover values reported by WD 01. Raw numbers were used because adjusted numbers reduced the SWC's potential entitlement to reasonable carryover.

[21] *See* R. Vol. 8 at 1373-74.

[22] This Fifth Methodology Order updates this chart with the new baseline year and calculates new number of seasons of reservoir space values.

shown in the Annual Percent Fill table in Finding of Fact 69 above, its space only failed to fill in 2004 (82%) and 2000 (99%). AFRD2 has a high likelihood of filling during multi-year droughts and after a dry year. *See* Finding of Fact 69. Therefore, any unfilled space in the fall will most likely fill. AFRD2 has an approximate one-year supply available in storage. *See* Finding of Fact 71. AFRD2's storage space only failed to fill in years when the natural flow volume at Heise was less than 3,100 KAF. In a dry year, AFRD2's historical carryover volume is often less than the maximum projected carryover need using the equation set forth in Finding of Fact 68 and 70. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover of 16,700 AF in years when the natural flow volume at Heise was less than 3,100 KAF is the reasonable carryover for AFRD2. *See* Finding of Fact 78.

iii. BID & Minidoka

74. Historically, in dry years, BID's and Minidoka's carryover volumes have been well above the maximum projected carryover need and it is unlikely that they will have reasonable carryover shortfalls in the future. *See* Finding of Fact 68 & 70; *see also* R. Vol. 37 at 7105. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted downward from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The reasonable carryover for BID and Minidoka is 0 AF. *See* Finding of Fact 78; *see also* R. Vol. 37 at 7105.

iv. Milner

75. Similar to A&B, Milner's reservoir space has the second lowest average annual rate of fill of all entities and has a high degree of variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that Milner's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68 & 70. Milner has an approximate one and one half water supply available in storage. *See* Finding of Fact 71. Because of its rate of fill, it is likely Milner will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the maximum projected carryover need of 16,100 AF is the reasonable carryover for Milner. *See* Finding of Fact 78.

v. NSCC

76. NSCC has a near-average annual rate of fill in comparison to all entities and an approximate one-year water supply available in storage. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68 & 70. Based on the evaluation criteria in CM Rule 42.01.g, the reasonable carryover for NSCC is 113,300 AF. *See* Finding of Fact 77.

vi. TFCC

77. TFCC has a near average annual rate of fill in comparison to all entities, but only 20% of a single year's water supply is available in storage. TFCC's storage space fills 97% of

the time and has a fill variability of 8%. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68 & 70. Based on the evaluation of the criteria in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover in dry years of 37,400 AF is the reasonable carryover for TFCC. *See* Finding of Fact 78.

78. Reasonable carryover values for the SWC members are as follows:

	Reasonable Carryover (Acre-Feet)
A&B	22,700
AFRD2	16,700
BID	0
Milner	16,100
Minidoka	0
NSCC	113,300
TFCC	37,400

E. Reasonable Carryover Shortfall

79. Reasonable carryover shortfall is the numerical difference between reasonable carryover and actual carryover, calculated at the conclusion of the irrigation season. Actual carryover is defined as the storage allocation minus the total storage use plus or minus any adjustments. Examples of adjustments include SWC water placed in the rental pool and SWC private leases. Adjustments are unique to each irrigation season and will be evaluated each year. Any storage water deliveries to entities other than the SWC for purposes unrelated to the original right will be adjusted so that the water is not included as a part of the SWC carryover volume. Water that is purchased or leased by an SWC member may become part of the carryover shortfall obligation. *See e.g.* R. Vol. 38 at 7201, n. 11 (Eighth Supplemental Order). Conversely, actual carryover must be adjusted to assure that water supplied by a SWC member to private leases or to the rental pool will not increase the reasonable carryover shortfall obligation to the same SWC member.

80. Reasonable carryover shortfall is calculated as follows:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

F. Determination of Curtailment Date

81. The Eastern Snake Plain Aquifer Model ("ESPAM") is the best scientific tool available to simulate aquifer and Snake River responses to stresses applied to the aquifer, such as ground water pumping from a well. Curtailment of junior ground water pumpers in response to the SWC Delivery Call would result in a reduction in the withdrawal of groundwater and a corresponding reduction in aquifer stress. ESPAM simulates the effects of the reduction in

aquifer stress and calculates predicted increases in aquifer discharge to the Snake River resulting from the curtailment of ground water pumping from the ESPA.

82. ESPAM simulations can be either steady-state or transient.

83. Merriam-Webster's Dictionary defines steady-state as "a state or condition of a system or process … that does not change in time." *Steady state*, Merriam-Webster.com, https://www.merriam-webster.com/dictionary/steady-state (April 19, 2023). A steady-state ESPAM simulation can only model increases in aquifer discharge to the Snake River resulting from continuous curtailments of an identical magnitude and location until the impacts of curtailment are fully realized. For example, a steady-state analysis of the curtailment of 1,000 acres, assumes that irrigation of the same 1,000 acres is curtailed every year at the same rate of consumptive use, until the impacts of that curtailment reach a steady state, or no longer change from year to year.

84. Steady-state analysis does not calculate the time to reach steady-state conditions nor describe the seasonal timing of the impacts. For the benefits of curtailment predicted by steady-state analysis to be realized by the river, the curtailment must occur continuously until steady-state is achieved. The assumption of continuous curtailment does not reflect reality in the SWC Delivery Call. Curtailments ordered as prescribed in the methodology are neither continuous nor long-term. Irrigation with ground water does not occur at a constant rate throughout the year nor from year to year. It is important to predict what benefits to the river are realized during the irrigation season in which injury has been determined. A steady-state ESPAM simulation cannot predict what benefits are realized during the irrigation season. In contrast, a transient ESPAM simulation will predict the timing of changes in river reach gains.

85. ESPAM was calibrated using one-month stress periods and can simulate a single (or partial) irrigation season of curtailment and predict the resulting increase in aquifer discharge to the Snake River during the same irrigation season using a transient simulation. In the context of this proceeding, the transient approach identifies the junior ground water rights that must be curtailed to produce increases in Snake River flows sufficient to offset material injury in the current irrigation season.

86. Only 9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year.[23] Fifty percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately four years. Ninety percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately 24 years.

87. A curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the full predicted IDS unless the shortfall exceeds the accruals to the near

[23] The near Blackfoot to Minidoka reach is the reach of the Snake River from which the SWC diverts.

Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights.

88. Steady-state simulations are appropriate for evaluating the average annual impact of aquifer stresses that have been, or will be, applied for decades (i.e., ground water pumping year after year, or continuous curtailment to the same date every year). The steady-state simulation of continuous curtailment applied in the Fourth Amended Methodology Order does not simulate the short-term curtailments prescribed in the methodology. The methodology prescribes curtailment only in years with a predicted IDS or carryover shortfall and prescribes the determination of a curtailment priority date that varies with the magnitude of the predicted shortfall.

89. Transient simulations are necessary to evaluate the impacts of aquifer stresses applied for short periods of time (i.e. short-term curtailments with varying priority dates). Transient simulations are necessary to simulate the short-term curtailments prescribed in the methodology.

CONCLUSIONS OF LAW

1. This order contains the methodology by which the Director will determine material injury to RISD and reasonable carryover to members of the SWC.

2. "The agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); IDAPA 37.01.01.600.

3. Idaho Code § 42-602 states that, "The director of the department of water resources shall have discretion and control of the distribution of water from all natural sources . . . . The director of the department of water resources shall distribute water . . . in accordance with the prior appropriation doctrine." According to the Hearing Officer, "It is clear that the Legislature did not intend to grant the Director broad powers to do whatever the Director might think right. However, it is clear also that the Legislature [in Idaho Code § 42-602] did not intend to sum up water law in a single sentence of the Director's authority." R. Vol. 37 at 7085. "Given the nature of the decisions which must be made in determining how to respond to a delivery call, there must be some exercise of discretion by the Director." *American Falls Res. Dist. No. 2 v. Idaho Dept. Water Resources*, 143 Idaho 862, 875, 154 P.3d 433, 446 (2007).

4. "The prior appropriation doctrine is comprised of two bedrock principles—that the first appropriator in time is the first in right and that water must be placed to a beneficial use." *In Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of A & B Irrigation Dist.*, 155 Idaho 640, 650, 315 P.3d 828, 838 (2012). "The concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*; *American Falls*, 143 Idaho at 879, 154 P.3d at 450 (stating that while an appropriation for a beneficial use is "a valuable right entitled to protection . . . . Nevertheless, that property right is still subject to other requirements of the prior appropriation doctrine."); *Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 131, 369 P.3d 897, 909

(2016) (explaining the "policy of beneficial use" serves as a "limit on the prior appropriation doctrine.").

5. "Concurrent with the right to use water in Idaho 'first in time,' is the obligation to put that water to beneficial use." *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447) (referring to "'the constitutional requirement that priority over water be extended only to those using the water'"). "'It is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation, and the amount of water necessary for the purpose of irrigation of the lands in question and the condition of the land to be irrigated should be taken into account.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar v. Goodrich*, 27 Idaho 26, 44, 147 P. 1073, 1079 (1915)).

6. "[T]he policy of securing the maximum use and benefit, and least wasteful use of Idaho's water resources, has long been the policy in Idaho." *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (citing *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 808, 252 P.3d 71, 89 (2011)). The Idaho Constitution enunciates a policy of promoting "optimum development of water resources in the public interest." Idaho Const. Art. XV, § 7; *Baker v. Ore-Ida Foods, Inc.,* 95 Idaho 575, 584, 513 P.2d 627, 636 (1973). "There is no difference between securing the maximum use and benefit and least wasteful use of this State's water resources and the optimum development of water resources in the public interest. Likewise, there is no material difference between 'full economic development' and the 'optimum development of water resources in the public interest.' They are two sides of the same coin. Full economic development is the result of the optimum development of water resources in the public interest." *Clear Springs*, 150 Idaho at 809, 252 P.3d at 90. "The policy of securing the maximum use and benefit, and least wasteful use, of the State's water resources applies to both surface and ground waters, and it requires that they be managed conjunctively." *Id.*

7. "Conjunctive administration 'requires knowledge by the [Department] of the relative priorities of the ground and surface water rights, how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts the water flows in that source and other sources.' . . . . That is precisely the reason for the CM Rules and the need for analysis and administration by the Director." *American Falls,* 143 Idaho at 877, 154 P.3d at 448.

8. The CM Rules incorporate all principles of the prior appropriation doctrine as established by Idaho law. *American Falls*, 143 Idaho at 873, 154 P.3d at 444; CM Rule 20.02, 10.12.

9. While the presumption under Idaho law is that an appropriator is entitled to his decreed water right and the CM Rules may not be applied to require a senior appropriator to demonstrate an entitlement to the water in the first place, there may be post-adjudication factors relevant to the determination of how much water is actually needed in responding to a delivery call. *American Falls*, 143 Idaho at 877-78, 154 P.3d at 448-49. Under the CM Rules and Idaho law, the Director has the "authority and responsibility to investigate claims when delivery calls

are made," and the "authority to evaluate the issue of beneficial use in the administration context." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840. As the Idaho Supreme Court stated, "'[w]hile the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception . . . the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost.'" *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 433). "[T]he Director must have some discretion to balance these countervailing considerations in a delivery call." *Id*. "'If this Court were to rule the Director lacks the power in a delivery call to evaluate whether the senior is putting the water to beneficial use, we would be ignoring the constitutional requirement that priority over water be extended only to those using the water.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447).

10. In responding to a delivery call under the CM Rules, the Director "may employ a baseline methodology as a starting point for considering material injury," provided the baseline methodology otherwise comports with the prior appropriation doctrine as established by Idaho law. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841; *see Methodology Remand Order* at 17.

11. Once the Director determines "that material injury is occurring or will occur," junior appropriators subject to the delivery call bear "the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call." *American Falls*, 143 Idaho at 878, 154 P.3d at 449; *Methodology Remand Order* at 31. Junior appropriators have the burden of proving by clear and convincing evidence that the delivery call is futile or otherwise unfounded. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841.

12. "This case illustrates the tension between the first in time and beneficial use aspects of the prior appropriation doctrine." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838. The Idaho Supreme Court has in this case "recognized the critical role of the Director in managing the water resources to accommodate both first in time and beneficial use aspects: 'Somewhere between the absolute right to use a decreed water right and an obligation not to waste it and to protect the public's interest in this valuable commodity, lies an area for the exercise of discretion by the Director.'" *Id.* at 651, 315 P.3d at 839 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 451). Thus, in this case the Director may use "a baseline methodology, both as a starting point for consideration of the Coalition's call and in determining the issue of material injury." *Id.* at 650-51, 315 P.3d at 838-39. However, "[i]f changing conditions establish that material injury is greater than originally determined pursuant to the baseline analysis, then adjustments to the mitigation obligation of the juniors must be made when the Director undertakes his mid-season calculations." *Methodology Remand Order* at 18.

13. In the context of conjunctive administration, the Director's methodology for projecting material injury does not impose an obligation upon members of the SWC to reprove

their water rights. To the extent water is available, members of the SWC are authorized to divert and store water in accordance with the terms of their licenses or decrees. Nothing established herein reduces that authorization. The question that the CM Rules require the Director to answer in this proceeding is, when water is not available to fill the water rights of the SWC, how much water is reasonably necessary for the SWC to accomplish the beneficial purpose of raising crops; because what is needed to irrigate crops may be less than the decreed or licensed quantities. *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar*, 27 Idaho at 44, 147 P. at 1079) ("'[i]t is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation"). Again, "[t]he concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*

14. Holders of senior-priority water rights may receive less than their licensed or decreed quantities and not suffer material injury within the meaning of the CM Rules. As a result, in-season demand should be viewed in light of reasonableness and optimum development of water resources in the public interest. CM Rules 20 and 42; *American Falls*, 143 Idaho at 876-80, 154 P.3d at 447-51; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650-652, 315 P.3d at 838-40.

15. Here, the Director has established a methodology for determining material injury to members of the SWC. The methodology predicts material injury to RISD by taking the difference between RISD and the FS. The years 2000 through 2021 were analyzed to select the BLY because the period of years captured current irrigation practices in a dry climate. Based upon evaluation of the record, members of the SWC were exercising more reasonable efficiencies during this time period than during the 1990s when supplies were more plentiful. During periods of drought when junior ground water users are subject to curtailment, members of the SWC should exercise reasonable efficiencies to promote the optimum utilization of the State's water resources. CM Rules 20 and 42; *American Falls,* 143 Idaho at 876-80, 154 P.3d at 447-51; *Clear Springs*, 150 Idaho at 807-10; 252 P.3d at 88-91; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650-652, 315 P.3d at 838-40.

16. At this time, with the recognition that the methodology is subject to adjustment and refinement, RISD will be equal to the historic demands associated with the BLY (2018) and will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

17. Recognizing that climate and surface water supplies (natural flow and storage) are inherently variable, the Director's predictions of material injury to RISD and reasonable carryover are based upon the best available information and the best available science, in conjunction with the Director's professional judgment as the manager of the State's water resources. Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will continue to

review and refine the process of predicting and evaluating material injury. The methodology will continue to be adjusted if the data supports a change.

18. If the Director predicts that the SWC will be materially injured because of a demand shortfall prediction, either in the preseason or in the midseason, the demand shortfall represents a mitigation obligation that must be borne by junior ground water users. If mitigation water in the amount of the projected RISD shortfall cannot be secured or optioned by junior ground water users to the satisfaction of the Director, the Director will curtail junior ground water users to make up any deficit. *See* Order on Pet. for Jud. Rev., at 19, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009),

19. In previous years, the Director used steady-state modeling when determining the curtailment priority date. The Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling to determine a curtailment priority date that would supply adequate water to the senior water right holders. While the first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling, the current version was calibrated using monthly stress periods and half-month time steps, a refinement that facilitates in-season transient modeling for calculating the response to curtailment of groundwater use. As part of the Director's ongoing obligation to evaluate the methodology, the Director must evaluate whether the use of steady-state continues to be supportable.

20. In surface water administration, uses by holders of junior priority surface water rights are curtailed until the senior surface water rights are fully satisfied, absent a futile call and if the senior surface water users need the water to accomplish a beneficial use. In other words, under surface water administration, junior surface water rights are generally curtailed unless the senior gets water in the quantity and at the time and place required.

21. Rule 43 of the CM Rules mandates that when the Director evaluates a mitigation plan, the mitigation plan must ensure that water is delivered to holders of senior priority surface water rights in both the quantity and at the time and place required by the senior. In considering a proposed mitigation plan pursuant to Rule 43, the Director must evaluate:

> **b.** Whether the mitigation plan will provide replacement water, *at the time and place required by the senior-priority water right*, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source *at such time and place as necessary* to satisfy the rights of diversion from the surface or ground water source. Consideration will be given to the history and seasonal availability of water for diversion so as not to require replacement water at times when the surface right historically has not received a full supply, such as during annual low-flow periods and extended drought periods.
> **c.** Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right *when needed during a time of shortage* even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for

> multi-season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior-priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.01.03.11.043.b-c (emphasis added). In other words, there is an assumption that senior water right holders calling for delivery of water under the CM Rules will receive, by curtailment or by mitigation, "replacement water at the time and place required by the senior-priority water right, sufficient to offset the depletive effect of ground water withdrawal . . . ." Only in a mitigation plan can "multi-season accounting of ground water withdrawals" be employed, and even then, the plan must "assure protection of the senior-priority right in the event the mitigation water source becomes unavailable."

22. The Director has an obligation to address a mitigation deficiency in the year it occurs. Mem. Decision & Order on Pet. for Jud. Rev., at 10, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-2446 (Twin Falls Cnty. Dist. Ct. Idaho Dec. 3, 2014); Mem. Decision & Order, at 8–9, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-4970 (Twin Falls Cnty. Dist. Ct. Idaho June 1, 2015).

23. As described in Finding of Fact 87, curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the *full* predicted IDS unless the shortfall exceeds the accruals to the near Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights. This methodology order depends on an annual evaluation of material injury and should also employ curtailment and or mitigation that supplies replacement water at the time and place required by the senior-priority water right in a quantity sufficient to offset the depletive effect of ground water withdrawal and to assure protection of the senior-priority right. Curtailment dates, periodically determined at time of recalculating in-season demand shortfall (IDS), should be calculated by a transient model simulation that will return the full quantity of water to the senior priority rights at the time and place required.

24. As described in Conclusion of Law 18, junior ground water users with approved mitigation plans to deliver storage water as mitigation must, to the satisfaction of the Director, secure or option mitigation water to avoid curtailment. By requiring that junior ground water users secure mitigation water or have options to acquire water in place during the season of need, the Director ensures that the SWC does not carry the risk of shortage to their supply. By not requiring junior ground water users to deliver or assign mitigation water until the Time of Need, the Director ensures that junior ground water users supply only the amount of mitigation water necessary to satisfy the RISD. All approved methods of mitigation shall be considered in the Director's review of projected RISD shortfall.

25. Unless there is reasonable certainty that junior ground water users can secure the predicted volume of water and provide that water at the Time of Need, the protection afforded to the senior water right holders is compromised. The risk of shortage is then impermissibly shouldered by the SWC. Members of the SWC should have certainty entering the irrigation

season and at midseason that mitigation water will be delivered or assigned at the Time of Need, or curtailment of junior ground water rights will be ordered.

26. Because climate and the supply that the SWC appropriated (natural flow and storage) are inherently variable, the Director cannot and should not insulate the SWC against all shortages. The Director can, however, protect the SWC against reasonably predicted shortages to RISD.

27. Currently, the USBR and USACE's Joint Forecast is an indispensable predictive tool at the Director's disposal for predicting material injury to RISD. Given current forecasting techniques, the earliest the Director can predict material injury to RISD with reasonable certainty is soon after the Joint Forecast is issued in early April. The pre-irrigation season supply forecast for A&B and Milner can be predicted solely from the Joint Forecast. To improve the accuracy of prediction, the pre-irrigation season supply forecast for AFRD2, BID, Minidoka, NSCC, and TFCC will currently be predicted from both the Joint Forecast and from flow data at Box Canyon.[24]

28. By shifting the April Forecast Supply prediction curve down one standard error of estimate, the Director purposely underestimates the water supply that is predicted. The Director further guards against RISD shortage by using the 2018 BLY, which has above average diversions, above average ET, below average in-season precipitation, and above average growing degree days. The 2018 BLY represents a year in which water supply did not limit diversions. The Director's prediction of material injury to RISD is purposely conservative. While it may ultimately be determined after final accounting that less mitigation water was owed than was provided, this is an appropriate burden for junior appropriators to carry. Idaho Cost. Art. XV, § 3; Idaho Code § 42-106. Shifting the prediction curve down one standard error of estimate and adoption of a BLY that uses above average diversions, above average temperatures and ET and below average precipitation is necessary to protect senior rights if the Director administers to an amount less than the full decreed quantity of the SWC's rights. *Methodology Remand Order* at 33, 35.

29. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water provided by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

30. "Storage water is water held in a reservoir and is intended to assist the holder of the water right in meeting their decreed needs." *American Falls*, 143 Idaho at 878, 154 P.3d at 449. "Carryover is the unused water in a reservoir at the end of the irrigation year which is retained or stored for future use in years of drought or low-water." *Id.* Under Idaho Code, "[o]ne may acquire storage water rights and receive a vested priority date and quantity, just as with any other water right," but "[t]here is no statutory provision for obtaining a decreed right to 'carryover' water." *Id.* Rather, carryover is a "component of the storage right." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-

[24] The method for predicting the natural flow supply may be subject change based upon improved predictive models.

0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009). Storage carryover is "permissible . . . absent abuse." *American Falls*, 143 Idaho at 880, 154 P.3d at 451.

31. The storage reservoirs implicated in this proceeding were intended to provide supplemental supplies of water "to create a buffer against the uncertainty of the weather." *Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation* (April 29, 2008) at 6. "The history of the development of the reservoir system, most recently Palisades, makes it clear that storage of water was a primary purpose to prevent disaster during periods of shortage as have been experienced in the recent past." *Id*. at 60. The purpose of carryover also is "insurance against the risk of future shortage." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009).

32. CM Rule 42.01 sets forth factors the Director "may consider in determining whether the holders of water rights are suffering material injury and using water efficiently and without waste." CM Rule 42.01 does not limit the Director's determination of reasonable carryover to consideration of the factors enumerated in CM Rule 42.01g, but only requires that the Director consider those enumerated factors. One such factor is "[t]he extent to which the requirements of the holder of a senior priority water right could be met with the user's existing facilities and water supplies." CM Rule 42.01g. This factor is qualified, however, by the provision that "the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years." CM Rule 42.01g. Thus, CM Rule 42.01g does not require water right holders to exhaust their storage water supplies prior to making a delivery call under the CM Rules. This is consistent with the purposes of the storage reservoirs and the carryover components of the storage water rights.

33. In considering CM Rule 42.01g in *American Falls*, the Idaho Supreme Court framed the SWC's challenge to the "reasonable carryover" provision as presenting the question of whether the holders of storage water rights are "entitled to insist on all available water to carryover for future years in order to assure that their full storage water is met (regardless of need)," *American Falls,* 143 Idaho at 879, 154 P.3d at 450, and answered this question in the negative:

> At oral argument, one of the irrigation district attorneys candidly admitted that their position was that they should be permitted to fill their entire storage water right, regardless of whether there was any indication that it was necessary to fulfill current or future needs and even though the irrigation districts routinely sell or lease the water for uses unrelated to the original rights. This is simply not the law of Idaho. While the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception. As previously discussed, the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost. Supra, paragraph 11.

Id. at 880, 154 P.3d at 451.

34. As discussed in the Findings of Fact, reasonable carryover is determined by projecting the water supply for the system. This is accomplished by projecting the 2002/2004 natural flow and average annual storage fill and the 2018 demand. Next, the Director examines the average annual rate of fill of each SWC entity's reservoir space to determine each entity's relative probability of fill. Finally, the Director examines the average annual carryover for prior comparable water conditions by reviewing Heise natural flow.

35. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of the SWC. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights.

36. Recognizing that reservoir space held by members of the SWC may fill, and to prevent the waste of water, junior ground water users are not required to deliver or assign the volume of reasonable carryover until after the Day of Allocation (defined in footnote 27, *infra*). Junior ground water users are obligated to hold the secured or optioned mitigation water until reservoir space held by the SWC fills. If the reservoir space does not fill, junior ground water right holders must deliver or assign the secured or optioned mitigation water to the senior water right holders up to the amount of storage space that did not fill.

ORDER

Consistent with the forgoing, the Director HEREBY ORDERS that, for purposes of determining material injury to RISD and reasonable carryover, the following steps will be taken:

1. Step 1: By April 1, members of the SWC will submit electronic shape files to the Department delineating the total anticipated irrigated acres for the upcoming year within their water delivery boundary or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent. Department staff will review submitted shapefiles and modify them as necessary to ensure that: (1) the total acreage count does not exceed the decreed number of acres; (2) all of the irrigated land is located within the decreed place of use; and (3) acres are not counted more than once due to overlapping polygons within a shape file or between shape files submitted by different SWC members. Because the SWC members can best determine the irrigated acres within their service area, the SWC should be responsible for submitting the information to the Department. If this information is not timely submitted, the Department will determine the total irrigated acres based upon past cropping patterns and current satellite and/or aerial imagery. If a SWC member fails or refuses to identify the number of irrigated acres within its service area by April 1, the Department will be cautious about recognizing acres as being irrigated if there is uncertainty about whether the acres are or will be irrigated during the upcoming irrigation season. The Department will electronically post

electronic shape files for each member of the SWC for the current water year for review by the parties. In determining the total irrigated acreage, the Department may account for supplemental ground water use. The Department currently does not have sufficient information to accurately determine the contribution of supplemental ground water to lands irrigated with surface water by the SWC. If and when reliable data is available to the Department, the methodology will be amended to account for the supplemental ground water use.

2. If the acreage count is under reported by more than five percent of the irrigated acreage limit of the water right, then the Department will assess the impact of this reduction in use of the water right on any mitigation requirement.

3. Step 2: Typically within the first two weeks of April, the USBR and USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage for the period April 1 through July 31. Within fourteen (14) days after issuance of the Joint Forecast, the Director will issue a final order predicting the April FS for the water year for each SWC entity. The Director will compare the April FS for each SWC entity to the BD for each SWC entity to determine if an in-season demand shortfall ("IDS") is anticipated for the upcoming irrigation season. The April FS for each SWC entity is the sum of the forecasted natural flow supply and the forecasted storage allocation for each SWC entity. The forecasted natural flow supply will be computed with regression algorithms. The forecasted storage allocation will be determined by comparing storage accruals in an analogous year(s). A transient ESPAM simulation will be run to calculate the curtailment priority date predicted to produce a volume of water equal to the IDS in the near Blackfoot to Minidoka reach between May 1 and September 30 of the current year. Curtailment will be simulated within the area of common ground water supply as described by CM Rule 50.01.

4. Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April IDS unless the April IDS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

5. Step 4: As soon as practical after the deadline for junior ground water users with approved mitigation plans to provide notice of secured water, the Director will issue an order curtailing junior ground water users who: (1) do not have approved mitigation plans; (2) fail to secure the required water consistent with their approved mitigation plans; or (3) otherwise fail to comply with their approved mitigation plans.[25]

[25] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

6. If, at any time prior to the Director's final determination of the April FS, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected demand shortfall determination.

7. Step 5: If the storage allocations held by members of the SWC fill, there is no reasonable carryover shortfall. If the storage allocations held by members of the SWC do not fill, within fourteen (14) days following the publication of Water District 01's initial storage report, which typically occurs soon after the Day of Allocation,[26] the volume of water secured by junior ground water users to fulfill the reasonable carryover shortfall shall be made available to injured members of the SWC. The amount of reasonable carryover to be provided shall not exceed the empty storage space on the Day of Allocation for that entity. If water is owed in addition to the reasonable carryover shortfall volume, this water shall be delivered or assigned to members of the SWC at the Time of Need, described below. The Time of Need will be no earlier than the Day of Allocation.

8. Step 6: Approximately halfway through the irrigation season, but following the events described in Step 5, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS and (3) estimate the Time of Need date.[27]

9. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The cumulative CWN volume will be calculated for all land irrigated with surface water within the boundaries of each member of the SWC. Volumetric values of CWN will be calculated using ET and precipitation values from the USBR's AgriMet program, irrigated areas provided by each entity, and crop distributions based on NASS data.

10. The FS for each SWC is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on regression analysis. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on an analogous year(s).

11. The calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

---

[26] The Day of Allocation is the time in the irrigation season when the Water District 01 watermaster can issue allocations to storage space holders after the reservoir system has achieved its maximum physical fill, maximum water right accrual, and any excess spill past Milner Dam has ceased. Tr. p. 902, lns. 7-25; p. 903, lns. 1-10.

[27] At the earliest established Time of Need for any member of the SWC, junior ground water users are required to provide remaining mitigation to all materially injured members of the SWC.

12. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. The Director will then issue revised RISD and DS values. Any increase to the projected IDS for each SWC entity is an additional mitigation obligation of the junior ground water users.

13. Upon a determination of an additional mitigation obligation, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to secure a volume of storage water or to conduct other approved activities pursuant to an approved mitigation plan that will deliver the additional mitigation obligation water to the injured members of the SWC at the Time of Need. If junior ground water users fail or refuse to submit this information within fourteen (14) days from issuance of a Step 6 order, the Director will issue an order curtailing junior ground water users.[28] A transient ESPAM simulation will be run to determine the priority date to produce the necessary additional mitigation obligation volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

14. Step 7: Shortly before the estimated Time of Need, but following the events described in Steps 5 and 6, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS; and (3) establish the Time of Need. The revised FS for each SWC entity is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on analogous year(s) with similar Blackfoot to Milner reach gains. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01.

15. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The Director will then issue revised RISD and IDS values.

16. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the demand shortfall volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

17. Step 8: At the Time of Need, junior ground water users are required to deliver to each injured member of the SWC the Step 7 revised IDS calculated at the Time of Need. Alternatively, any additional mitigation obligation calculated in Step 6 and Step 7 can be satisfied from each SWC member's reasonable carryover if (a) the reasonable carryover exceeds the additional mitigation obligation, and (b) the junior ground water users secure sufficient water to replace the reasonable carryover pursuant to an approved mitigation plan.

[28] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

18. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water delivered by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

19. Step 9: Following the end of the irrigation season (on or before November 30), the Department will determine the total actual volumetric demand and total actual CWN for the entire irrigation season. This information will be used for the analysis of reasonable carryover shortfall, selection of future BLY, and for the refinement and continuing improvement of the method for future use.

20. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of SWC. These estimates will be based on, but not limited to, the consideration of the best available water diversion and storage data from Water District 01, return flow monitoring, comparative years, and RISD. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the reasonable carryover shortfall volume by September 30 of the following year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

IT IS FURTHER ORDERED that this Fifth Methodology Order supersedes all previously issued methodology orders in this matter.

Dated this _21st_ day of April 2023.

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **NOTICE OF HEARING, NOTICE OF PREHEARING CONFERENCE, AND ORDER AUTHORIZING DISCOVERY**

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") as well as his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

The Director anticipates that one or more parties will request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both of the orders. Normally, a party has 15 days to request a hearing. However, time is of the essence because the irrigation season has commenced for many water users. Idaho's Constitutional Convention intended that there be no unnecessary delays in the delivery of water pursuant to a valid water right. *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, 143 Idaho 862, 874, 154 P.3d 433, 445 (2007). "Clearly, a timely response is required when a delivery call is made and water is necessary to respond to that call." *Id*. Accordingly, the Director, consistent with the obligation to timely administer water rights, will take the proactive step of setting the matter for hearing, will set a prehearing conference, and will authorize discovery. Should the parties mutually agree that a hearing is unwarranted, the parties may file a stipulated motion to vacate.

NOTICE OF HEARING

NOTICE IS HEREBY GIVEN that the Department will hold a hearing on the Methodology Order and As-Applied Order on **June 6–10, 2023. The hearing will begin on June 6 at 9:00 a.m. (MST).** Subsequent starting and ending times will be scheduled during the hearing. The last day of the hearing, June 10, is a Saturday. The day is reserved if needed to complete the hearing.

The hearing will take place at the Department's State Office, located at **322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho**.

All parties wishing to participate in the hearing shall be present in person. Remote participation will be allowed for those who wish to observe the hearing. To request remote participation information, contact Sarah Tschohl at the phone number or email listed below.

The hearing will be held in accordance with the provisions of Chapters 2 and 17, Title 42 and Chapter 52, Title 67, Idaho Code, as well as the Department's Rules of Procedure, IDAPA 37.01.01. A copy of the Rules of Procedure may be obtained from the Department upon request or at: https://adminrules.idaho.gov/rules/current/37/370101.pdf.

The hearing will be conducted in a facility that meets the accessibility requirements of the Americans with Disabilities Act. If you require special accommodation to attend, participate in, or understand the hearing, please advise the Department no later than five (5) days prior to the hearing. Inquiries for special accommodations should be directed to Sarah Tschohl, Idaho Department of Water Resources, P.O. Box 83720, Boise, Idaho 83720-0098, telephone: (208) 287-4815, email sarah.tschohl@idwr.idaho.gov.

NOTICE OF PREHEARING CONFERENCE

NOTICE IS HEREBY GIVEN that the Department will hold a prehearing conference on the Methodology Order and As-Applied Order on **April 28, 2023, at 1:30 p.m. (MST)**. The conference will take place at the Department's State Office, located at **322 E. Front Street, 6th Floor, Conference Rooms 602B–D, Boise, Idaho**. All parties wishing to participate in the prehearing conference must appear in person or by video conferencing. The parties shall come prepared to identify the issues to be addressed at the hearing.

To attend the conference via computer or smartphone, please click the following Webex link, follow the prompts, and wait to be admitted by the meeting host: https://idahogov.webex.com/idahogov/j.php?MTID=mb39d4fed7de1bfefe8462aaefafd3dbb.

To join the conference via telephone, please dial 1(415) 655-0001 (US Toll) and enter the following meeting access code when prompted: 2450 253 0090.

The prehearing conference will be held in accordance with the provisions of Chapter 17, Title 42, and Chapter 52, Title 67, Idaho Code, and the Department's Rules of Procedure, IDAPA 37.01.01. A copy of the Rules of Procedure may be obtained from the Department upon request or at https://adminrules.idaho.gov/rules/current/37/370101.pdf.

The conference will be conducted in a facility that meets the accessibility requirements of the Americans with Disabilities Act. If you require special accommodation to attend, participate in, or understand the conference, please advise the Department no later than one (1) day before the conference. Inquiries for special accommodations should be directed to Sarah Tschohl, Idaho Department of Water Resources, P.O. Box 83720, Boise, Idaho 83720-0098, telephone: (208) 287-4815, email sarah.tschohl@idwr.idaho.gov.

ORDER AUTHORIZING DISCOVERY

IT IS HEREBY ORDERED that the parties are authorized to immediately conduct and engage in discovery pursuant to IDAPA 37.01.01.521.

IT IS FURTHER ORDERED that, pursuant to IDAPA 37.01.01.053, documents filed in this proceeding may be served on the parties and the Department via email. Service on the Department shall be made by email to file@idwr.idaho.gov. Service on the parties shall be made by email to the email addresses listed in the Certificate of Service below.

Dated this 21st day of April 2023.

GARY SPACKMAN

Governor Brad Little

Director Gary Spackman

May 1, 2023

RE: Notice of Possible Curtailment of Ground Water Rights with Priority Dates Junior to December 30, 1953 - Surface Water Coalition Delivery Call

Dear Water Right Holder,

You are receiving this letter because, according to the records of the Idaho Department of Water Resources ("Department"), you are the holder of one or more water rights authorizing diversion of ground water from the Eastern Snake Plain Aquifer Area of Common Ground Water Supply ("ESPA") that are not covered by an approved and effectively operating mitigation plan. Because your water right(s) are not currently covered by an approved and effectively operating mitigation plan, **your water right(s) *may* be subject to curtailment this 2023 irrigation season.**

On April 21, 2023, the Director of the Department issued the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"). The As-Applied Order predicts a shortfall in the water supply for senior priority Snake River water rights during the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to (later than) **December 30, 1953**.

The Department scheduled a hearing for the parties to the As-Applied Order on **June 6–10, 2023.** After the hearing the Director will decide whether to issue a curtailment order. If the Director issues a curtailment order, ground water rights junior to December 30, 1953, could be subject to curtailment unless the holders of junior priority ground water rights mitigate for ground water diverted pursuant to an approved mitigation plan.

Holders of ground water rights affected by a curtailment order may participate in an approved mitigation plan. See Idaho Code § 42-5259. If you are already a member of a ground water district, please contact and work with the district to ensure the district's records are up to date. If you are not a member of a ground water district, you may want to contact the nearest ground water district to inquire if the district will allow you to join.

Holders of ground water rights potentially subject to curtailment may also submit a proposed mitigation plan to the Director in accordance with Conjunctive Management Rule 43.[1] See IDAPA 37.03.11.043. However, please be aware the approval process for a mitigation plan is time-consuming. A proposed mitigation plan submitted now may not be approved in time for the 2023 irrigation season. Upon receipt of a proposed mitigation plan, the Director will publish notice for two successive weeks, after which ten days will be allowed for the filing of protests. The Director may hold a hearing if necessary to determine whether a proposed mitigation plan will mitigate injury to the SWC caused by diversions of ground water authorized by junior priority ground water rights. If the proposed mitigation plan is protested, the Director will hold a hearing. Please be advised that a curtailment order is not stayed pending evaluation of a mitigation plan.

[1] For example, a copy of the proposed mitigation plan submitted by the SWC & IGWA can be found here: https://idwr.idaho.gov/wp-content/uploads/sites/2/legal/CM-MP-2016-001/CM-MP-2016-001-20160309-SWCs-and-IGWAs-Stipulated-Mitigation-Plan-and-Request-for-Order.pdf

Information regarding the ongoing status of this matter may be found under the Current Topics section of the Department's website at: https://idwr.idaho.gov/ If you have questions concerning this notice, please contact the Department's State Office in Boise at 208-287-4800, or the water district watermaster in your area who regulates ground water within the ESPA and copied below. Water district boundaries can be found on the web at https://idwr.idaho.gov/water-rights/water-districts/map/, and Watermaster contact information can be found on the web at https://research.idwr.idaho.gov/files/ExternalReports/wdcontactsrpt.pdf

Respectfully,

GARY SPACKMAN
Director

c. Blake Jordan, Watermaster, Water Districts 100, 110 and 120
Brian Ragan, Watermaster, Water District 130
Jaxon Higgs, Watermaster, Water District 140
Greg Shenton, Watermaster, Water District 31
Preston Marcroft, Watermaster, Water District 34

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 Docket No. CM-MP-2015-003 **A&B IRRIGATION DISTRICT'S NOTICE OF COMMUNICATION TO WATER DISTRICT 01 WATERMASTER**

COMES NOW, A&B Irrigation District ("A&B" or "District"), by and through counsel of record, and hereby provides notice of its communication to the Water District 01 Watermaster regarding compliance with the Director's *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* wherein the Director required affected junior ground water right holders to establish "that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan" on or before May 5, 2023. *See* April As Applied Order at 6. Counsel mailed and emailed the letter to Watermaster Tony Olenichak on May 5, 2023. *See* Ex. A.

Notwithstanding this notice A&B reserves all rights with respect to the calculated proportionate share of the predicted injury, i.e. 458 acre-feet, and has requested a hearing on that issue.

Dated this 5th day of May, 2023.

Re: SWC Delivery Call / Notice of Mitigation Water (*Final Order Regarding April 2023 Forecast Supply (Steps 1-3)*)

Dear Tony:

I am writing on behalf of the A&B Irrigation District ("A&B" or "District") in reference to the Director's April 21, 2023 *Final Order Regarding April 2023 Forecast Supply* ("April Order"). In that order the Director noted that affected junior ground water right holders must establish "that they can mitigation for their proportionate share of the predicted demand shortfall of 75,200 acre-feet in accordance with an approved mitigation plan." *See* April Order at 6. The Director identified A&B's proportionate share as 458 acre-feet with respect to certain junior priority ground water rights held by A&B (36-15127A et al.). *See id.* at 5, n. 5. A&B also has an approved mitigation plan. *See Final Order Approving Mitigation Plan,* CM-MP-2015-003, Dec. 16, 2015.

A&B is requesting a hearing on the Director's calculation of its "proportionate share" of the April forecasted injury and that matter is set to be heard June 6-10, 2023. A&B reserves all rights with respect to this issue and by communicating this notice does not waive any of those rights with respect to the Director's order. Whether the District's proportionate share will change is unknown at this time.

Notwithstanding, A&B hereby provides notice of available mitigation water and requests that you confirm to the Director that 458 acre-feet of A&B's 2023 storage allocation will be available for assignment and delivery to mitigate injury to TFCC as predicted in the April Order if necessary. As you may be aware A&B carried over 58,900 acre-feet in its Palisades Reservoir space from 2022, and its American Falls Reservoir space is currently filling in 2023.

Regardless of the final allocation, A&B presently has 458 acre-feet to deliver to injured Coalition members, including TFCC, for mitigation purposes if required.

A&B believes this letter satisfies the Director's April Order. If you have any questions please call me at (208) 733-0700.

Sincerely,

Travis Thompson
Partner

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **NOTICE OF MATERIALS DEPARTMENT WITNESSES MAY RELY UPON AT HEARING AND INTENT TO TAKE OFFICIAL NOTICE**

On May 2, 2023, the Director issued a *Scheduling Order and Order Authorizing Remote Appearance at Hearing* ("Scheduling Order"). In the Scheduling Order, the identified two Idaho Department of Water Resources ("Department") employees who will testify at the hearing—Jennifer Sukow and Matthew Anders. The Director set a deadline of May 5, 2023, for the Department to provide the materials Ms. Sukow and Mr. Anders may rely upon at the hearing as well as a summary of topics Ms. Sukow and Mr. Anders may testify to. *Scheduling Order* at 2. The Department may augment its list of materials Ms. Sukow and Mr. Anders may rely upon at the hearing, if needed, by May 10, 2023. *Id*.

A. Materials Ms. Sukow and Mr. Anders may rely upon during the June 6-10 hearing.

The materials Ms. Sukow and Mr. Anders may rely upon at the hearing have been divided into four separate folders and are publicly available on the Department's website[1] as a downloadable zipped file labeled "Materials Department Witnesses May Rely Upon at Hearing".

1st Folder: "2022 Technical Working Group ("TWG")". Presentations, agendas, data and communications related to the TWG meetings this fall.

2nd Folder: "2023 5th Amended Methodology Order". Data files and notes related to baseline year, irrigated acres, project efficiency, reasonable carryover.

3rd Folder: "2023 April As-Applied Order". Copies of all files in the April Background Information folder on IDWR's website.

4th Folder: "ESPAM Report". ESPAM documentation reports from Jennifer Sukow.

[1] The webpage for the above-captioned matter can be located at: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

B. Topics Ms. Sukow may testify about at the hearing:

- Steady-state vs. transient modeling / simulations for the Eastern Snake Plain Aquifer Model (ESPAM).
- Calculation of curtailment priority dates for the SWC's delivery call.

C. Topics Mr. Anders may testify about at the hearing:

- Base Line Year (BLY)
- Forecast Supply
- SWC Irrigated Acres
- Crop Water Need
- Near Real Time Mapping Evapo Transpiration at high Resolution with Internalized Calibration (NRT METRIC)
- Project Efficiency
- Reasonable Carryover
- Twin Falls Canal Company's increase in diversions
- The 2023 Technical Working Group meetings

D. Director's intent to take official notice.

Department Rule of Procedure 602 states in pertinent part:

> The [Director] may take official notice of any facts that could be judicially noticed in the courts of Idaho, of generally recognized technical or scientific data or facts within the agency's specialized knowledge and records of the agency. The [Director] may ask agency staff to prepare reports or memoranda to be used in deciding a contested case, and all such reports and memoranda shall be officially noticed by the [Director]. The [Director] shall notify the parties of specific facts or material noticed and the source of the material noticed, including any agency staff memoranda and data. This notice should be provided either before or during the hearing, and must be provided before the issuance of any order that is based in whole or in part on facts or material officially noticed. Parties must be given an opportunity to contest and rebut the facts or material officially noticed.

IDAPA 37.01.01.602.

The Director hereby notifies the parties that he intends to take official notice of the facts and data in the "2022 Technical Working Group ("TWG")" folder, "2023 5th Amended Methodology Order" folder, "2023 April as Applied Order folder", and "ESPAM Report" folder.

Concurrent with this notice, copies of those documents will be posted to the Department's docket for this proceeding. Pursuant to Rule of Procedure 602, any party may file a written objection "to contest and rebut the facts or material to be officially noticed" on or before June 4, 2023. IDAPA 37.01.01.602.

DATED this 5th day of May 2023.

Gary Spackman
Director

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S REQUEST FOR HEARING AND STATEMENT OF ISSUES**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGAITON DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby request a hearing in the above-referenced matter pursuant to I.C. § 42-1701A(3) and submit the following list of issues regarding the Director's *Fifth Amended*

Order Regarding Methodology et al. and the *Final Order Regarding April 2023 Forecast Supply* issued on April 21, 2023.

I. *Fifth Methodology Order*

The Coalition requests a hearing on the following issues:

1) Whether 2018 is the proper baseline year for each Coalition member pursuant to the criteria identified in the methodology order;
2) Whether the reasonable carryover amounts identified for each Coalition member are proper pursuant to the criteria identified in the methodology order;
3) Whether current year project efficiency is recalculated for each year after Cropland Data Layer (CDL) data for this year becomes available and prior to this current year's project efficiency being used in the 15-year rolling average;
4) Whether current year project efficiency is recalculated for each year after CDL updates become available and are included in the 15-year rolling average; and
5) Whether the Coalition members can receive assigned mitigation storage water if they do not participate in the Water District 01 rental pool.

II. *April As Applied Order*

The Coalition requests a hearing on the following issue:

1) Whether the order provides that IGWA has an option to comply with the mitigation plan approved in CM-MP-2016-001 to avoid curtailment by complying with the mitigation plan approved in CM-MP-2009-007 instead;

A&B Irrigation District requests a hearing on the following issues:

1) Whether the order's identified proportionate share (458 acre-feet) of the predicted injury (75,200 acre-feet) to TFCC is calculated correctly based upon A&B's actual diversion

and use of water rights that are subject to the identified curtailment date (junior to December 30, 1953); and

2) Whether the steady-state use of the ESPAM 2.2 in identifying A&B's proportionate share is consistent with the transient use of the model in identifying ground water rights subject to curtailment as outlined in the *Fifth Methodology Order*.

Jessica Nielsen
Assistant for Travis L. Thompson

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER DETERMINING DEFICIENCY IN IGWA'S NOTICE OF SECURED WATER**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order revised the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC").

Step 3 of the Methodology Order states that by May 1, or within fourteen days from issuance of a final order predicting a shortfall, "whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share" of any predicted shortfall unless the forecast is revised. *Methodology Order* at 40. Step 3 further states that "[t]he secured water will not be required to be delivered to the injured members of the SWC until the Time of Need." *Id*.

On April 21, 2023, the Director also issued his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order") in which the Director determined the predicted shortfall obligation for junior ground water users for 2023. The Director concluded that Twin Falls Canal Company ("TFCC") is the only entity with a predicted shortfall for 2023 and the shortfall value is 75,200 acre-feet. The Director ordered:

> On or before May 5, 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation

plan, the Director will issue an order curtailing the junior-priority ground water user.

As-Applied Order at 6.

On May 5, 2023, the Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of certain water districts[1] (collectively "Districts"), filed with the Department a *Notice of Ground Water District Mitigation* ("Notice of Mitigation"). The Notice explains that "IGWA has three approved mitigation plans." *Notice of Mitigation* at 2. IGWA states the first plan (the "2009 Storage Water Mitigation Plan") "authorizes the Districts to provide mitigation via the delivery of storage water to the SWC." *Id*. IGWA states that the second plan "authorizes the Districts to obtain mitigation credit" for various activities. *Id*. IGWA states the third plan (known as the "2015 Settlement Agreement Mitigation Plan") authorizes the Districts to "obtain mitigation protection by complying with a settlement agreement entered into between the Districts and the SWC in 2015." *Id*. IGWA recognizes that "[u]nder this plan, the Districts are required to conserve 240,000 acre-feet of water and deliver 50,000 acre-feet of storge annually to the SWC . . . ." *Id*.

Since the 2015 Settlement Agreement Mitigation Plan was approved by the Department, IGWA has only mitigated under that plan. This year, IGWA is proposing something new. Certain ground water district members are seeking to mitigate under the 2009 Storage Water Mitigation Plan and other ground water district members are seeking to mitigate under the 2015 Settlement Agreement Mitigation Plan. Instead of relying on one or two mitigation plans for all members, individual ground water districts are seeking to mitigate under different mitigation plans. IGWA states Bingham Ground Water District, Bonneville-Jefferson Ground Water District and Jefferson-Clark Ground Water District will provide mitigation under the 2009 Storage Water Mitigation Plan. *Notice* at 2. IGWA includes the following table to identify what it believes each district's proportionate share of the shortfall is:

District	Proportionate Share
Bingham GWD	13,384
Bonneville-Jefferson GWD	8,469
Jefferson-Clark GWD	6,939
Total	28,792

Id.

IGWA states "Attached hereto as Appendix A are copies of storage water leases totaling 38,714 acre-feet, submitted on behalf of the above-identified Districts." *Id*. at 3.

[1] IGWA's submitted the Notice of Mitigation on behalf of: North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District. *Notice of Mitigation* at 1.

IGWA includes the following table to identify the districts planning to mitigate under the 2015 Settlement Agreement Mitigation Plan and each district's proportionate shares of the reduction obligation and the storage water obligation:

District	240,000 AF	50,000 AF
Aberdeen-American Falls GWD	39,395	8,705
Carey Valley GWD	821	173
Henry's Fork GWD + Madison GWD	6,299	0
Magic Valley GWD	37,931	8,000
North Snake GWD	29,765	6,410
Total	114,211	23,288

Id.

IGWA states:

> Each District's proportionate share of 240,000 is based on the Director's allocation set forth in the *Amended Final Order Regarding Compliance with Approved Mitigation Plan* issued April 24, 2023, in this matter. Each District's proportionate share of 50,000 is based on the allocation IGWA has utilized since the Settlement Agreement Plan was implemented in 2016.

Id.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

1. Idaho Code § 42-602, addressing the authority of the Director over the supervision of water distribution within water districts, states:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

2. The first question that must be answered is whether the ground water districts can mix the mitigation plans in the way they are proposing. IGWA's "hybridization" of mitigation plans presents serious questions about whether mixing of mitigation plans is allowable.

2009 Storage Water Mitigation Plan

3. The 2009 Storage Water Mitigation Plan was submitted to the Department on November 9, 2010. IGWA's Mitigation Plan for the Surface Water Coalition Delivery Call at 7, *In re Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, No. CM-MP-2009-007 (Idaho Dep't of Water Res. Nov. 9, 2009) [hereinafter "2009 Storage Water Mitigation Plan"]. The plan was submitted by IGWA "on behalf of its Ground Water District Members and its other water user members …, for and on behalf of their respective members and those groundwater users who are non-member participants in their mitigation activities…." *2009 Storage Water Mitigation Plan* at 1.

4. The mitigation plan proposes supplying water stored in Snake River reservoirs to the SWC "that will be available on an annual basis for delivery to SWC entities as may be required by the Director's orders." *Id*. at 3. While the plan was submitted for the benefit of IGWA's members and non-member participants, the plan clearly states that IGWA will mitigate for all ground water users, not just its members and non-member participants:

> This Mitigation Plan will mitigate *any and all* material injury by guaranteeing and underwriting the senior water user's water supply. If the Director projects material injury for a senior water user, then the Ground Water Users will provide water for mitigation in accordance with this Mitigation Plan for that mitigation year. . . .This Mitigation Plan will *fully mitigate and compensate* the senior water user for material injury by making water available for direct delivery of replacement water by the Water District 1 Watermaster when necessary during the irrigation season.
> . . . .
>
> [T]he Ground Water Users will supply sufficient water to eliminate the resulting water debt ("excess use") of Twin Falls Canal Company on the books of Water District 1."

Id. at 3–4 (emphasis added).

5. The *Order Approving Mitigation Plan* issued on June 3, 2010, makes clear that any obligation determined will be set based on the amount of shortfall determined through the methodology order process: "IGWA's obligation to provide storage water shall be determined as set forth in the Methodology Order"; "IGWA's obligation for mitigation shall be determined as set forth in the Methodology Order." Order Approving Mitigation Plan at 10, *In re Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, No. CM-MP-2009-007 (Idaho Dep't of Water Res. Nov. 9, 2009).

6. The *Order Approving Mitigation Plan* makes clear that if IGWA does not provide the required storage, all ground water rights are subject to curtailment: "[I]f IGWA does not provide proof of acquisition of storage water and commitment of storage water as set forth above, ground water rights pumping from the Eastern Snake Plain Aquifer will be curtailed according to the Methodology Order to provide water to the SWC." *Id.* at 11.

7. Pursuant to the plain language of the 2009 Storage Water Mitigation Plan and *Order Approving Mitigation Plan*, IGWA cannot pick and choose who gets the benefit of storage water if IGWA is not providing storage water amounts equal to the shortfall obligation. If IGWA submits to the Director adequate contracts to establish it has secured storage water and the amount secured is less than the shortfall obligation, the Director will credit the contracted volume against the overall obligation, thus reducing the overall obligation for all ground water users. This approach is consistent with the plain language of the plan and the order approving the plan.

8. Furthermore, IGWA is required to provide the Director with legally enforceable contracts, options or similar documentation to establish that it has secured the water necessary to meet the carryover obligation. *See* Order on Petition for Judicial Review at 19, *A&B Irrigation Dist. v. Tuthill*, No. CV-2008-551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009). The Director concludes that IGWA has failed to provide documentation that satisfies this standard. Before the Notice of Mitigation was filed, the two entities listed on the contracts, Bingham Groundwater District and Bonneville-Jefferson Groundwater District, hired independent counsel. See *Notice of Substitution of Counsel for Bingham Ground Water District* at 1 (May 2, 2023) ("Pursuant to this substitution of counsel, Bingham Ground Water District will forthwith be represented independently of IGWA."); *Substitution of Counsel* at 1 (Jan. 4, 2023) ("COMES NOW Skyler C. Johns, of Olsen Taggart PLLC, and hereby substitutes as counsel on behalf of Intervenor, Bonneville-Jefferson Ground Water District.") Because the Notice of Mitigation was filed by counsel for IGWA, it is unclear whether IGWA has the authority to submit the ground water districts contracts to the Director for consideration. Second, even if IGWA had authority to submit the agreements, a review of the Departments records indicate that most of the leases have not been approved by Water District 01 due to a lack of payment of fees. Without payment of the required fees, the Districts have not yet secured the required water.

9. Because IGWA failed to provide appropriate contracts, ground water users are not in compliance with the 2009 Storage Water Mitigation Plan and will not be entitled to curtailment protection under the plan. If IGWA subsequently submits documentation establishing that it has authority to submit contracts on behalf of Bingham and Bonneville-Jefferson Groundwater Districts and pays the required Water District 01 fees, but the amount of water secured is less than the shortfall obligation, then the Director will credit the contracted volume against the overall shortfall obligation, thus reducing the overall obligation for all ground water users.

2015 Settlement Agreement Mitigation Plan

10. In 2015, the SWC and certain members of IGWA[2] entered into the *Settlement Agreement Entered into June 30, 2015 Between Participating Members of the Surface Water*

[2] The following eight ground water districts and one irrigation district are signatories to the SWC-IGWA Agreement: Aberdeen-American Falls Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Carey Valley Ground Water District, Fremont Madison Irrigation District, Jefferson Clark Ground Water District, Madison Ground Water District, Magic Valley Ground Water District, and North Snake Ground Water District.

Coalition and Participating Members of the Idaho Ground Water Appropriators, Inc. ("SWC-IGWA Agreement").

11. In October of 2015, the SWC and IGWA entered into an *Addendum to Settlement Agreement* ("First Addendum").

12. On March 9, 2016, the SWC and IGWA submitted the *Surface Water Coalition's and IGWA's Stipulated Mitigation Plan and Request for Order* ("Request for Order") to the Director. *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res. Mar. 9, 2016). Attached to the Request for Order as Exhibits B, and C were the SWC-IGWA Agreement, the First Addendum. These documents were submitted as a stipulated mitigation plan in response to the SWC's delivery call. *Request for Order* at 3.

13. On May 2, 2016, the Director issued the *Final Order Approving Stipulated Mitigation Plan* ("Order Approving Mitigation Plan"), which approved the parties' mitigation plan subject to conditions. *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.).

14. On December 14, 2016, the SWC and IGWA entered into the *Second Addendum to Settlement Agreement* ("Second Addendum"). *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.). The *Second Addendum* amended the *SWC-IGWA Agreement* by providing additional details concerning the implementation of certain sections, most notably sections 3.a (Consumptive Use Volume Reduction); 3.e (Ground Water Level Goal and Benchmarks), 3.m (Steering Committee), and 4.a. (Adaptive Water Management). *Compare SWC-IGWA Agreement* §§ 3–4, *with Second Addendum* § 2.

15. On February 7, 2017, the SWC and IGWA submitted the *Surface Water Coalition's and IGWA's Stipulated Amended Mitigation Plan and Request for Order* ("Second Request for Order"). *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.). The SWC and IGWA requested that the Director issue an order approving the Second Addendum as an amendment to the mitigation plan. *Second Request for Order* ¶ 6.

16. On May 9, 2017, the Director issued the *Final Order Approving Amendment to Stipulated Mitigation Plan* ("Order Approving Amendment to Mitigation Plan"), approving the Second Addendum as an amendment to the parties' mitigation plan subject to conditions. *Order Approving Amendment to Mitigation Plan* at 5, *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.).

17. In the SWC-IGWA Agreement, the SWC and IGWA members agreed, among other things, that "[t]otal ground water diversion shall be reduced by 240,000 ac-ft annually." *SWC-IGWA Agreement* § 3.a.i. The SWC and IGWA stipulated that "[e]ach Ground Water and Irrigation District with members pumping from the ESPA shall be responsible for reducing their proportionate share of the total annual ground water reduction or in conducting an equivalent private recharge activity." *SWC-IGWA Agreement* § 3.a.ii.

18. The parties also agreed that "IGWA will provide 50,000 ac-ft of storage water though private lease(s) of water from the Upper Snake Reservoir system, delivered to the SWC 21 days after the date of allocation, for the use to the extent needed to meet irrigation requirements." *SWC-IGWA Agreement* § 3.b.i.

19. The SWC and IGWA also stipulated "that the mitigation provided by participating IGWA members under the [2015] Agreements is, provided the [2015] Agreements are implemented, sufficient to mitigate for any material injury caused by the groundwater users who belong to, and are in good standing with, a participating IGWA member." *Request for Order* ¶ 8. The SWC and IGWA agreed "[n]o ground water user participating in this [SWC-IGWA] Agreement will be subject to a delivery call by the SWC members as long as the provisions of the [SWC-IGWA] Agreement are being implemented." *SWC-IGWA Agreement* § 5.

20. In the Notice of Mitigation, the ground water districts wanting to mitigate pursuant to the 2015 Settlement Agreement Mitigation Plan have proportionately determined their individual obligations for both reduction obligations and storage obligations. While the 2015 Settlement Agreement Mitigation Plan allows for determining the proportionate share of the reduction obligation of the parties, it does not authorize the 50,000 acre-foot storage volume to be shared proportionately by the parties. To be in compliance with the plan, the entire 50,000 acre-feet must be provided.

21. Moreover, in response to a breach of the mitigation plan in 2021, the Director approved a one-year settlement agreement to remedy the 2021 breach. *Amended Final Order Regarding Compliance with Approved Mitigation Plan* at 20, *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res. Apr. 24, 2023). In the settlement agreement, the parties agreed that "IGWA will collectively provide to the SWC an additional 30,000 acre-feet of storage water in 2023 and an additional 15,000 acre-feet of storage water in 2024 within 10 days after the Date of Allocation of such year. Such amounts will be in addition to the long-term obligations set forth in section 3 of the Settlement Agreement and approved Mitigation Plan." *Settlement Agreement* at 2. While we are not yet to the day of allocation, the Director wants to ensure that it is clear to the parties that, as with the 50,000 acre-foot obligation, this additional amount of storage water is not subject to proportional sharing.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED that IGWA's *Notice of Ground Water District Mitigation* is deficient and fails to demonstrate that IGWA is operating in accordance with an approved mitigation plan. If the Director issues an order of curtailment after the June 6–10, 2023 hearing, IGWA's members and non-member participants will not be entitled to curtailment protection under either the 2009 Storage Water Mitigation Plan or 2015 Settlement Agreement Mitigation Plan.

Dated this 23rd day of May 2023.

GARY SPACKMAN
Director

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER GRANTING REQUESTS FOR HEARING**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") as well as his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

Anticipating that one or more parties would request a hearing in response to one or both of the orders, the Director also issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. The Notice of Hearing set the hearing for the Methodology Order and As-Applied Order for June 6–10, 2023, at the Department's State Office, located at 322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho.

On April 28, 2023, the Department received the following filings:

- *The Coalition of Cities' Request for Hearing*; [1]
- *McCain Foods USA, Inc.'s Request for Hearing and Objection*;
- *The Coalition of Cities' Amended Request for Hearing*; and
- *Pocatello's Request for Hearing*.

On May 2, 2023, the Department received *IGWA's Petition for Reconsideration and Request for Hearing*.[2]

[1] For purposes of the request for hearing, the "Coalition of Cities" refers to the Idaho cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell.

[2] For purposes of the request for hearing, ("IGWA") refers to the following ground water districts: North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, Aberdeen-

On May 4, 2023, the Department received the following filings:

- *Amalgamated Sugar Company's Request for Hearing, Objection, Identification of Issues and Notice of Mitigation*;
- *City of Idaho Falls Challenge and Request for Hearing*;
- *Bonneville-Jefferson Ground Water District's Request for Hearing*; and
- *Bingham Ground Water District's Request for Hearing*.

On May 5, 2023, the Department received the *Surface Water Coalition's Request for Hearing and Statement of Issues*.

ANALYSIS AND CONCLUSIONS OF LAW

Idaho Code § 42-1701A(3) provides in relevant part:

> Unless the right to a hearing before the director . . . is otherwise provided in by statute, any person aggrieved by any action of the director, including any decision, determination, order or other action . . . who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action.

The parties have not previously been afforded an opportunity for hearing on the Methodology Order or the As-Applied Order and are entitled to a hearing pursuant to Idaho Code § 42-1701A(3). As described above, the Director has already set a hearing on the Methodology Order and the As-Applied Order for June 6–10, 2023. To resolve any question regarding the status of the pending requests for hearing, the Director will grant the requests and will hold the hearing as previously set in the Notice of Hearing.

ORDER

IT IS HEREBY ORDERED that the parties' requests for hearing are GRANTED. The hearing will be held as previously noticed in the *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery*: June 6–10, 2023, at the Department's State Office, located at 322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho.

DATED this 23rd day of May 2023.

GARY SPACKMAN
Director

American Falls Area Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Amended Notice of Mitigation**

Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, Henry's Fork Ground Water District, Bonneville-Jefferson Ground Water District, and Bingham Ground Water District (collectively, the "Districts"), through their respective counsel, hereby provides notice that the Districts can mitigate for their proportionate share of the demand shortfall predicted in the *Final Order Regarding April Forecast Supply (Methodology Steps 1-3)* ("*April 2023 As-Applied Order*") issued April 21, 2023, in this matter.

Background

The *April 2023 As-Applied Order* applies steps 1-3 of the Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover. It predicts that the Surface Water Coalition ("SWC") will experience an in-season demand shortfall of 75,200 acre-feet in the absence of mitigation by junior-priority groundwater users. The order states: "On or before May 5, 2023, ground water users holding consumptive water

rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan." (*April 2023 As-Applied Order*, p. 6.) "IGWA's proportionate share of the predicted DS of 75,200 acre-feet is 63,645 acre-feet." *Id*. at 5, fn 5.

IGWA has three approved mitigation plans. Its "Storage Water Plan" authorizes its member ground water districts to provide mitigation via the delivery of storage water to the SWC. (Order Approving Mitigation Plan, *In the Matter of the Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, IDWR Docket No. CM-MP-2009-007, June 3, 2010, p. 10.) Under this plan, "IGWA must provide proof of rental or an option to rent storage water and of a commitment of the storage water to the SWC within the deadlines provided by the Methodology Order and any order of the Director implementing the Methodology Order for a given year." *Id*.

IGWA's "Aquifer Enhancement Plan" authorizes its member ground water districts to obtain mitigation credit for reach gains that accrue to the SWC as a result of (a) conversions of farmland from groundwater to surface water irrigation; (b) fallowing of groundwater-irrigated acres through the Conservation Reserve Enhancement Program (CREP), Agricultural Water Enhancement Program (AWEP), or other voluntary program; and (c) groundwater recharge." (Order Approving Mitigation Plan, *In the Matter of the Idaho Ground Water Appropriators, Inc.'s Mitigation Plan for Conversions, Dry-Ups, and Recharge*, IDWR Docket No. CM-MP-2009-006, May 14, 2010, p. 1.) Under this plan, "[i]f mitigation credit is sought by IGWA, the Director shall determine the appropriate credit, if any, to provide." *Id*. at 2.

IGWA's "Settlement Agreement Plan" authorizes its member ground water districts to obtain mitigation protection by complying with a settlement agreement entered into between them and the SWC in 2015. (Final Order Approving Stipulated Mitigation Plan, *In the Matter of IGWA's Settlement Agreement Mitigation Plan*, IDWR Docket No. CM-MP-2016-001, May 2, 2016; Final Order Approving Amendment to Stipulated Mitigation Plan, *In the Matter of IGWA's Settlement Agreement Mitigation Plan*, IDWR Docket No. CM-MP-2016-001, May 9, 2017.) Under this plan, each district is required to conserve its proportionate share of 240,000 acre-feet of groundwater and collectively deliver 50,000 acre-feet of storage annually to the SWC as set forth in the *Amended Final Order Regarding Compliance with Approved Plan* issued April 24, 2023.

On May 5, 2023, IGWA filed a *Notice of Ground Water District Mitigation* stating that some of its member ground water districts would mitigate under IGWA's Storage Water Plan and others would mitigate under IGWA's Settlement Agreement Plan, in accordance with their respective proportionate mitigation obligations under each plan. On May 23, 2023, the Director issued an *Order Determining Deficiency in IGWA's Notice of Secured Water* which ruled that IGWA is not allowed to apportion mitigation obligations under the Storage Water Plan or the Settlement Agreement Plan based on each ground water district's proportionate share. In effect, the order requires ground water districts to mitigate under one plan only. Based on the May 23 order, IGWA files this amended notice of mitigation.

Notice of Mitigation

IGWA will mitigate under the Storage Water Plan in 2023. The *April 2023 As-Applied Order* states that IGWA's share of the total predicted demand shortfall of 75,200 acre-feet is 63,645 acre-feet. (*April 2023 As-Applied Order*, p. 5, fn 5.) Attached hereto as Appendix A are copies of storage lease contracts secured by IGWA's member ground water districts totaling 77,714 acre-feet.

The *Order Determining Deficiency in IGWA's Notice of Secured Water* orders, for the first time, that the Districts not only provide contracts showing the water they have secured, but that they pay the Water District 1 fees in addition. The Districts object to this because the order approving the Storage Water Plan does not require IGWA to pay the Water District 1 fees before the date that storage water is committed to the SWC. (Order Approving Mitigation Plan, *In the Matter of Idaho Ground Water Appropriators, Inc.'s Mitigation Plan In Response To The Surface Water Coalition's Water Delivery Call*, IDWR Docket No. CM-MP-2009-007, June 3, 2010.) To the contrary, the order allows IGWA to "provide proof of rental or an option to rent storage water," and that "proof of rental or an option to rent storage water shall consist of fully executed and irrevocable contracts with holders of Snake River storage." By the nature of option contracts, fees due to Water District 1 cannot be paid until the option is exercised. It is also significant that IGWA has never failed to pay the Water District 1 fees due under any storage contract for mitigation water delivered to the SWC.

Without waiving IGWA's objection to the prepayment of Water District 1 fees, IGWA's member districts have gone ahead and paid the Water District 1 fees for 2023. IGWA reserves the right to secure storage water in future years and pay Water District 1 fees at the time such storage is transferred to the SWC.

Dated this 1st day of June, 2023.

APPENDIX A

Storage Leases

WATER DISTRICT #1 RENTAL POOL - PRIVATE LEASE AGREEMENT

Idaho Irrigation District (lessor) agrees to lease 6,678 acre-feet of storage to Bingham Ground Water District (lessee) for the 2023 irrigation season at a price of $[redacted] according to the rules and regulations contained in the Water District #1 Rental Pool Procedures.

Description of Lease:

Name of River or Stream from which lease is diverted: Snake River

Canal or Pump Name and location: TBD

Place of Use description: TBD

Water Right Appurtenant to Lands: TBD

An Idaho Water Resources Board surcharge (10% of the purchase price) plus a $1.30 per acre-foot administrative fee must be received by Water District #1 prior to the approval of the storage lease).

If the reservoir storage system fails to fill in the season following the year leased, the lessor's storage allocation shall be reduced by the amount leased to offset any impacts to other spaceholders' storage accruals according to the approved Water District #1 Rental Pool Procedures pursuant to Idaho Code Section 42-1765. The lessor understands the net effect of this rule is to make an amount of the lessor's space (equal to the amount leased) last-to-fill in the reservoir system for the irrigation season following the lease.

☐ If the lease is for irrigation purposes, the Applicant, by checking this box, certifies that the use of this leased storage water complies with the moratorium on new consumptive uses as outlined in Rental Pool Procedure 3.4. Failure to meet the conditions contained in Rental Pool Procedure 3.4 may be grounds for denying the application.

If the leased storage is diverted by a diversion outside the area regulated by Water District #1, the applicant, by signing this agreement agrees to report to the Watermaster of the water district containing the diversion, the daily amounts of leased storage diverted during the year. The Watermaster of that district, according to Rental Pool Procedure 4.3.108, must then report to the Water District #1 Watermaster the daily rental diverted by November 30th. Failure to report the daily rental diversion may result in the rental not being delivered in Water District #1's final rental delivery records.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Enterprize Canal Co., whose mailing address is PO BOX 583, Ririe, ID 83443, ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before May 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**

5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices.** All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

ADDRESSES TO BE USED FOR NOTICES AND DELIVERY OF LEASE PAYMENTS SHALL BE AS FOLLOWS:

Lessor: Enterprize Canal Co.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Idaho Irrigation District, whose address is 496 E 14th St, Idaho Falls, ID 83404, Idaho Falls, Idaho 83402 ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before ~~May~~ JULY 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**

5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

11. **Binding Effect.** This Lease shall be binding upon the respective heirs, successors, and assigns of the parties.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Idaho Irrigation District, whose address is 496 E 14th St, Idaho Falls, ID 83404, Idaho Falls, Idaho 83402 ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 2500 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of [redacted] per acre-foot ([redacted] total).

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before July 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**
   5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices.** All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

WATER DISTRICT #1 RENTAL POOL - PRIVATE LEASE AGREEMENT

Idaho Irrigation District (lessor) agrees to lease 2500 acre-feet of storage to Bonneville Jefferson Ground Water District (lessee) for the 2023 irrigation season at a price of $325,000.00 according to the rules and regulations contained in the Water District #1 Rental Pool Procedures.

Description of Lease:

Name of River or Stream from which lease is diverted: Snake River

Canal or Pump Name and location: To be determined

Place of Use description: To be determined

Water Right Appurtenant to Lands: To be determined

An Idaho Water Resources Board surcharge (10% of the purchase price) plus a $1.30 per acre-foot administrative fee must be received by Water District #1 prior to the approval of the storage lease).

If the reservoir storage system fails to fill in the season following the year leased, the lessor's storage allocation shall be reduced by the amount leased to offset any impacts to other spaceholders' storage accruals according to the approved Water District #1 Rental Pool Procedures pursuant to Idaho Code Section 42-1765. The lessor understands the net effect of this rule is to make an amount of the lessor's space (equal to the amount leased) last-to-fill in the reservoir system for the irrigation season following the lease.

[X] If the lease is for irrigation purposes, the Applicant, by checking this box, certifies that the use of this leased storage water complies with the moratorium on new consumptive uses as outlined in Rental Pool Procedure 3.4. Failure to meet the conditions contained in Rental Pool Procedure 3.4 may be grounds for denying the application.

If the leased storage is diverted by a diversion outside the area regulated by Water District #1, the applicant, by signing this agreement agrees to report to the Watermaster of the water district containing the diversion, the daily amounts of leased storage diverted during the year. The Watermaster of that district, according to Rental Pool Procedure 4.3.108, must then report to the Water District #1 Watermaster the daily rental diverted by November 30th. Failure to report the daily rental diversion may result in the rental not being delivered in Water District #1's final rental delivery records.

MULTI-YEAR TRIBAL WATER LEASE AGREEMENT

This WATER LEASE ("**Lease Agreement**") is made and entered into by and between the SHOSHONE-BANNOCK TRIBES of the Fort Hall Reservation ("Tribes"), acting through the Tribal Rental Pool Committee in the operation of the Tribal Water Supply Bank and the Fort Hall Business Council, and the IDAHO GROUND WATER APPROPRIATORS, INC. , a non-profit corporation, acting for and on behalf of North Snake Ground Water District, Magic Valley Ground Water District, Southwest Irrigation District, American Falls – Aberdeen Ground Water District and Carey Valley Ground Water District, (collectively "IGWA") and is effective on the date executed by both parties hereto.

RECITALS

A. Pursuant to *The 1990 Fort Hall Indian Water Rights Agreement*, the Tribes are entitled to federal storage contract rights, held in trust for the Tribes by the United States, in an amount of 2.8059% of the storage space in American Falls Reservoir and 6.9917% of the storage space in Palisades Reservoir. These contract storage rights are equivalent to full capacity volumes of 46,931 acre-feet in American Falls Reservoir and 83,900 acre-feet in Palisades Reservoir, and those water rights and the associated volumes of water are referred to herein as the "**Tribal Water Supply Bank**." Due to sedimentation, the maximum annual volumes accrued to each of the contract storage rights are less than the stated capacity volumes.

B. The Shoshone-Bannock Tribes have adopted the Shoshone-Bannock Tribal Water Supply Bank Rules, which have been duly approved by the Idaho Water Resources Board, for the purposes of leasing storage water held by the Tribes in American Falls Reservoir for delivery and use in the Snake River Basin anywhere within Idaho, and for leasing storage water held by the Tribes in Palisades Reservoir for delivery and use in the Snake River Basin above Milner Dam.

C. IGWA is a non-profit corporation which was established to represent its membership, which is currently comprised of eight groundwater districts, two irrigation districts, and numerous other municipal, commercial, and industrial groundwater users in Idaho. IGWA has entered into an agreement with the Surface Water Coalition to resolve disputes related to the impacts of groundwater use on surface water rights. IGWA desires to lease storage water from the Tribes based on the terms herein for use as mitigation flow in the Snake River and for use in meeting other aspects of the agreement.

Now, therefore, and in consideration of the covenants, obligations, and other valuable consideration referred to herein, the Tribes and IGWA agree as follows:

1. Quantity of Leased Water. The water that is the subject of this Lease Agreement is referred to herein as the "**Rental Volume**". The quantity of Rental Volume shall be defined under the terms below.
   a. Each year of the Lease Agreement, the Tribes will commit to provide and IGWA will commit to rent from the Tribes a volume of up to 25,000 acre-feet, subject to the terms and conditions provided below.

b. The Rental Volume will be supplied from the Tribal Water Supply Bank, which is comprised of the Tribes' federal contract storage rights in American Falls and Palisades Reservoirs, as defined in the *1990 Fort Hall Indian Water Rights Agreement* and decreed in the Snake River Basin Adjudication. Subject to Section 1.f below, the Tribal Water Supply Bank water that will be available for the Rental Volume excludes all other water rights and water assets of the Tribes, and such water rights and assets are not a part of this Lease Agreement.

c. The Tribes and IGWA agree that the Tribes' obligation to deliver water under this Lease Agreement is contingent on the availability of water from the Tribal Water Supply Bank for rental. Each year, the Tribes will declare the quantity of water in the Tribal Water Supply Bank available as Rental Volume to IGWA within 5 business days of the Water District 1 publication date of storage allocation.

d. The quantity of water in the Tribal Water Supply Bank available as Rental Volume will be calculated by the Tribes as the Tribal Water Supply Bank storage allocation remaining after satisfaction of: (1) the estimated Michaud Unit irrigation demands, (2) an additional volume of storage water, not to exceed 5,000 acre-feet, to mitigate uncertainty, and (3) other lease contracts, separate from this Lease Agreement, entered into by the Tribes for use of the Tribal Water Supply Bank that carry a higher annual lease price as described in Section 1.e below. The quantity of available water may also be limited by court orders or other regulatory enforcement of applicable laws and regulations applicable to the Tribal Water Supply Bank water.

e. Nothing in this Lease Agreement shall operate to prevent the Tribes from leasing additional water from the Tribal Water Supply Bank to another party or parties. The total annual water supplies available to satisfy lease contracts from the Tribal Water Supply Bank will be determined as stated in Section 1.d above and allocated to each lease contract, which is active on the publication date of storage allocation, as follows: (1) the lease contract with the highest lease price ($/acre-foot) will be satisfied in full up to its annual contract volume, (2) the lease contract with the second-highest lease price will next be satisfied in full up to its annual contract volume, and (3) additional lease contracts will be satisfied in a similar fashion with priority for supply given to lease contracts based on lease prices. The allocation of annual supplies to active lease contracts does not apply to Carryover Volume and Additional Volume described below.

f. The Tribes hold a "**Reserve Supply**" equal to 25,276 acre-feet that was secured under a 2015 settlement agreement. The Tribes may request delivery of the Reserve Supply each year up to an annual volume of 10,000 acre-feet and the Reserve Supply is administered as Tribal storage allocation in American Falls Reservoir. Each year of this Lease Agreement, the Tribes, in their sole discretion, may elect to use the Reserve Supply to fulfill Rental Volume commitments defined in Section 1.a above. The Reserve Supply will be provided through the Tribal Water Supply Bank.

g. Subject to reservoir space being available in the Tribal Water Supply Bank and approval by the Tribes, IGWA may elect to hold and carryover a portion of the Rental Volume in storage and not take delivery of that carryover water in the same year that it was declared available by the Tribes. This volume of water is referred to herein as "**Carryover Volume**". The Carryover Volume shall be accounted for as an independent volume of water within the Tribal Water Supply Bank, such that the annual Rental Volume calculation and other Tribal uses of its federal contract storage rights identified in Section 1.d shall not be drawn from the Carryover Volume. The Carryover Volume shall be annually reduced based on a pro-rata portion of the annual evaporative losses applied to the Tribal Water Supply Bank. The total Carryover Volume accumulated in previous years shall not exceed 10,000 acre-feet.

h. The Carryover Volume shall be reset to zero when the Tribal Water Supply Bank refills, indicated by a combined allocation of at least 128,000 acre-feet to the Tribes' federal contract storage rights in American Falls and Palisades Reservoirs. No repayment or reimbursement shall be due to IGWA for lost Carryover Volume due to a reset. The Carryover Volume shall reset to zero at the end of this Lease Agreement term, unless otherwise agreed to in a separate writing by the Parties.

i. IGWA will have the option to lease additional water from the Tribal Water Supply Bank, in excess of 25,000 acre-feet, if it is made available for rental by the Tribes. This volume of water is referred to herein as "**Additional Volume**". It is understood and acknowledged by IGWA and the Tribes that Additional Volume rentals may impact the availability of water as Rental Volume in future years. IGWA shall communicate to the Tribes an interest in leasing Additional Volume by April 1 of the year in which the Additional Volume is requested. The Tribes' approval of Additional Volume leases shall be at the sole discretion of the Tribes and shall not be subject to the calculations defined in Section 1.d.

2. Water Delivery and Administration. Delivery of the Rental Volume shall occur when the Rental Volume has been released from either Palisades or American Falls Reservoir, and appropriately deducted from the Tribes' storage account in these reservoirs. The Tribes and IGWA shall cooperatively work together to ensure the delivery of the Rental Volume to IGWA and the appropriate administration of such water.

   a. The quantity of water to be leased under this Lease Agreement under Paragraph 1 has been reviewed by the Tribal Rental Pool Committee as required by the Shoshone-Bannock Tribal Water Supply Bank Rules.

   b. Any carriage or other losses of Rental Volume that may occur downstream from American Falls Reservoir or Palisades Reservoir, as the source of water, shall be the responsibility of IGWA.

   c. The scheduling of releases of the Rental Volume shall be in the sole discretion of IGWA, provided however, that IGWA will notify and cooperate with the Tribes and the U.S. Bureau of Reclamation (Reclamation) to implement any storage release request. The

Tribes and IGWA will cooperate with Reclamation and Water District 1 in measuring and accounting for the Rental Volume at the outflow of American Falls Reservoir and/or Palisades Reservoir.

d. The Rental Volume, Carryover Volume, and Additional Volume leases shall only be available for use by IGWA or assignment to the Surface Water Coalition to satisfy IGWA's obligations, and shall not otherwise be available for re-marketing or assignment to a third party, unless such re-marketing or assignment is agreed upon in writing by the Tribes.

3. Term. The term of this Lease Agreement shall be for five (5) years commencing on April 1, 2021 and terminating on October 31, 2025.

   a. After the initial term, the Lease Agreement will be automatically renewed on an annual basis, unless a termination letter is sent by the Tribes or IGWA six (6) months prior to the desired termination date of the Lease Agreement.

4. Agreement Contingencies. This Lease Agreement, and obligations hereunder, are expressly contingent upon:

   a. Acquiring all approvals that may be required for the rental, release, delivery, and use of the Rental Volume by IGWA;

   b. Payment by IGWA pursuant to Paragraph 5 below;

   c. Delivery of the Rental Volume by the Tribes to IGWA prior to October 31 of each year during the term of this agreement, subject to the provisions of Paragraphs 5-7 below.

5. Payment. The "**Annual Lease Payment**" shall be calculated as the Rental Volume declared and made available for lease by the Tribes multiplied by the Lease Price. The Lease Price during the 5-year term shall be calculated as follows:

Year	Lease Price Adjustment ($/acre-foot)	Lease Price ($/acre-foot)
2021	$0	$[redacted]
2022	Maximum of $1 per acre-foot or % change in Consumer Price Index for All Urban Consumer (CPI) from January 1, 2021 to December 31, 2021 multiplied by the 2021 Lease Price, rounded to the nearest dollar.	2021 Lease Price + 2022 Adjustment
2023	Maximum of $1 per acre-foot or % change in CPI from 1/1/2022 to 12/31/2022 multiplied by the 2022 Lease Price, rounded to the nearest dollar	2022 Lease Price + 2023 Adjustment
2024	Maximum of $1 per acre-foot or % change in CPI from 1/1/2023 to 12/31/2023 multiplied by the 2023 Lease Price, rounded to the nearest dollar	2023 Lease Price + 2024 Adjustment
2025	Maximum of $1 per acre-foot or % change in CPI from 1/1/2024 to 12/31/2024 multiplied by the 2024 Lease Price, rounded to the nearest dollar	2024 Lease Price + 2025 Adjustment

a. If the full Rental Volume is not available in any particular year, IGWA shall pay the dollar per acre-foot Lease Price stated above for that year for the Rental Volume available.

b. IGWA shall be obligated to make the Annual Lease Payment each year whether or not IGWA takes delivery of any amount of the Rental Volume by October 31 of each year.

c. IGWA shall make payments for the Carryover Volume in the year that the water is first declared available as Rental Volume by the Tribes, and shall not make a second payment for the water in subsequent years when it is delivered for use.

d. The annual lease price adjustment shown in the table above shall be applied in each subsequent year that the Lease Agreement is renewed under Section 3.a after the initial 5-year term.

e. Payments for Additional Volume leases shall be based on the lease price stated above for the year in which the Additional Volume lease takes place, and such payments shall represent an addition to the Annual Lease Payment due to the Tribes.

6. Payment Schedule. The lease payments shall be payable by IGWA as follows:

a. 50% of the total Annual Lease Payment is due by July 1 of each year of the Lease Agreement;

b. The balance of the total Annual Lease Payment is due by November 1 of each year of the Lease Agreement;

c. Payments for Additional Volume leases shall follow the payment schedule defined above for the Rental Volume leases.

d. All payments are payable by wire transfer to the Tribes within five (5) business days of due date stated above.

7. Termination. Either the Tribes or IGWA may terminate this Lease Agreement in accordance with the provisions below:

a. Either the Tribes or IGWA may terminate this Lease Agreement:

i. For any violation or breach of the terms of this Lease Agreement; or
ii. If any of the terms and conditions of any approval of the lease arrangement, or other applicable state or federal law, rule, or regulation, or the administration of the leased water, are inconsistent with the terms of this Lease Agreement.

b. Termination shall be effective within 30 days of provision of written notice to the other party detailing the basis for such termination. The party against whom such termination

is asserted shall have 30 days to cure the violation or breach that is the basis for the termination.

c. Termination may be subject to the Conflict Resolution provisions of Section 8.e, if the party against whom termination is sought disagrees with the basis of the termination.

d. In the event of any such termination, there shall be an accounting of lease payments paid by IGWA and leased water delivered by the Tribes as of the termination date. IGWA shall pay for all leased water delivered. In the event IGWA has submitted payment for leased water that remains undelivered by the termination date, the Tribes shall refund any lease payments received for leased water that remains undelivered, and the Tribes will not be obligated to provide such water unless the parties otherwise agree in writing.

8. Miscellaneous Provisions.

a. Amendments. No amendment or modification of this Lease Agreement or its provisions shall be effective unless documented in writing and approved and executed by all parties with the same formality as this Lease Agreement.

b. Force Majeure. Delays or inability to perform any of the requirements of this Lease Agreement within the term or time limits prescribed herein shall be excused to the extent that performance is rendered impossible by any event beyond the control of either party including but not limited to drought, governmental acts or orders or restrictions, existing legal obligations, failure of suppliers, war, terrorism or any other reason where failure to perform is beyond the reasonable control of and is not caused by the conduct of the non-performing party. A force majeure event shall not include financial inability to complete performance of an obligation.

c. Notices. All notices and other communications under this Lease Agreement shall be in writing. Notices shall be deemed as duly received on the date of service, if served personally on the party to whom notice is to be given. Notices shall also be deemed as duly received five (5) days from the date said notice is mailed to the party to whom notice is to be given, either by first class mail, registered or certified, postage prepaid or by express delivery with handling prepaid, and properly addressed as follows:

Phone: (208) 232-6101

d. Compliance with Laws and Usage. The Parties, at their own expense, will comply with all federal, state, and tribal laws, ordinances, rules, and regulations applicable to this Lease Agreement and the business conducted pursuant thereto.

e. Conflict Resolution. In the event of any dispute, claim, question, or disagreement arising from or relating to the Lease Agreement or the breach thereof, the Tribes and IGWA agree as follows:

   i. The Tribes and IGWA agree to initially submit such dispute to non-binding mediation in an effort to resolve the same.
   ii. In the event that formal legal proceedings are commenced in connection with this Agreement, the parties agree that the Shoshone-Bannock Tribal Court shall be the sole, proper and exclusive forum and venue for such proceedings.
   iii. The laws and regulations of the Shoshone-Bannock Tribes shall govern the interpretation of this Lease Agreement and/or any formal legal proceedings commenced regarding this Lease Agreement.

f. Attorneys' Fees. In any action concerning the terms or enforcement of this Lease Agreement, the prevailing party shall be entitled to recover reasonable costs and attorneys' fees, including any costs and attorneys' fees incurred in appellate proceedings.

g. Binding Effect. All of the covenants, conditions, and provisions of this Lease Agreement shall inure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

h. Entire Agreement. This Lease Agreement constitutes the entire agreement between the parties and supersedes any prior understandings or oral or written agreements between the parties respecting the within subject matter.

i. Severability. If any provision of this Lease Agreement shall ever be held to be invalid or unenforceable, such invalidity or unenforceability shall not affect any other provision of this Lease Agreement, but such other provisions shall continue in full force and effect.

j. Headings. The headings of paragraphs and sections in this Lease Agreement are inserted only as a matter of convenience and for reference purposes, and they do not define, limit, or describe the scope of this Lease Agreement or the intent of any of the provisions thereof.

k. Sovereign Immunity. Neither the execution of this Lease Agreement, nor any provision contained herein shall be interpreted to act as a waiver of the Shoshone-Bannock Tribes' sovereign immunity. The Shoshone-Bannock Tribes hereby specifically reserves and retains its sovereign immunity and any rights appurtenant thereto. The Shoshone-Bannock Tribes' sovereign immunity from suit may only be waived by resolution of the Fort Hall Business Council.

l. Contract Interpretation. The parties have participated jointly in the negotiation and drafting of this Lease Agreement. In the event an ambiguity or question of intent or interpretation arises, this Lease Agreement shall be construed as if drafted jointly by the parties and no presumption or burden of proof shall arise favoring or disfavoring any party by virtue of the authorship of any of the provisions of this Lease Agreement.

m. No Third Party Beneficiary. This Lease Agreement is exclusively for the benefit of and governs only the parties hereto. The Tribes and IGWA are the only parties to this Compact and are the only parties entitled to enforce the terms of this Lease Agreement. Nothing in this Lease Agreement gives, or is intended to give, or shall be construed to give or provide any benefit or right, whether directly, indirectly or otherwise, to third persons.

n. Indemnification. IGWA indemnifies the Tribes and its officers, subsidiaries, agents, and employees (the "Indemnitees") and IGWA shall hold the Indemnitees harmless for any damages, claims, demands, personal injury, illness, death, property damage, or other loss resulting in any manner in connection with IGWA's use of the water leased pursuant to this Lease Agreement.

o. No Waiver. Forbearance in enforcing any right or remedy under this Lease Agreement shall not be deemed a wavier nor shall it be the basis for an inference that any party hereto has waived any provision hereof or that a party has waived any right hereunder.

This Lease Agreement shall be signed in triplicate and shall be effective when signed by both the Tribes and IGWA.

STORAGE WATER LEASE
This Storage Water Lease ("Agreement") is entered into between North Fork Reservoir Company, ("Lessor"), and **Henry's Fork Groundwater District** (the "District").
RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. THE DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to the DISTRICT, and the DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. Storage Water Lease. Lessor hereby leases to the DISTRICT storage water for 2021-2025 only, at which the DISTRICT is required to pay rent as follows:

1,500 acre-feet at $20.00 per acre-foot. **IGWA will pay** $1.30 acre-foot Water District 01 administrative fee and $2.00 State Water Supply Bank Fee for a total payment of $3.30 per acre-foot.
2. Term. The initial term of this Lease shall commence March 13, 2021, and end November 30, 2025.

3. Payment of Rent. The DISTRICT will pay the rent to Lessor in one installment, on or before 1st day October, of each year.

4. Administrative Fees. IGWA will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. Use of Leased Water.

5.1 The assignment, delivery, and use of leased storage water will be determined by the DISTRICT and is subject to the final accounting for the year by the Water-master of Water District 1 and any applicable Water District 1 Rental Pool Rules.
5.2 This Lease does not include any right to use storage water below Milner Dam.
5.3 The storage water available to the DISTRICT under this Lease may be assigned and delivered by the DISTRICT to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.
5.4 Any storage water not used or assigned by the DISTRICT by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.
5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. Representations by Lessor. Lessor covenants and represents that:

6.1 It will provide to the DISTRICT all storage water leased under this Lease.
6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering this Lease.

7. Breach. If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect any or all of the following cumulative remedies:

(a) Terminate this Lease.
(b) Seek specific performance of this Lease;

8. Assignment. This Lease may not be assigned by the DISTRICT without the express written consent of Lessor, but the storage water leased by the DISTRICT under this Lease may be assigned or otherwise made available to any other person or entity.

9. Dispute Resolution. Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.
9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation by a mediator designated by mutual Lease of the parties. The mediation will be held in **Fremont** County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.
9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.
9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction and agree that **Fremont** County is the proper venue.
9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.1 and 9.2 are pending.

10. Notices. All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing

for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

ADDRESSES TO BE USED FOR NOTICES AND DELIVERY OF LEASE PAYMENTS SHALL BE AS FOLLOWS:
Lessor: North Fork Reservoir Company
Michael Rasmussen, President
Address: PO Box 250
Rexburg, Idaho 83201

ONE-YEAR TRIBAL WATER LEASE AGREEMENT

This One-Year Tribal Water Lease Agreement ("Lease Agreement") is entered into between the SHOSHONE-BANNOCK TRIBES of the Fort Hall Reservation ("Tribes"), acting through the Tribal Lease Pool Committee in the operation of the Tribal Water Supply Bank and the Fort Hall Business Council, and the following three groundwater districts: North Snake Ground Water District, Magic Valley Ground Water District, and American Falls-Aberdeen Ground Water District (collectively, "Districts"). The Tribes and Districts may be referred to herein collectively as the "parties" and individually as a "party." This Lease Agreement shall be effective on the date executed by both parties.

RECITALS

A. Pursuant to *The 1990 Fort Hall Indian Water Rights Agreement*, the Tribes are entitled to federal storage contract rights, held in trust for the Tribes by the United States, in an amount of 2.8059% of the storage space in American Falls Reservoir and 6.9917% of the storage space in Palisades Reservoir. These contract storage rights are equivalent to full capacity volumes of 46,931 acre-feet in American Falls Reservoir and 83,900 acre-feet in Palisades Reservoir. These water rights and associated volumes of storage water are referred to herein as the "Tribal Water Supply Bank." Due to sedimentation, the maximum annual volumes accrued to each of the contract storage rights are less than the stated capacity volumes.

B. The Shoshone-Bannock Tribes have adopted the Shoshone-Bannock Tribal Water Supply Bank Rules, which have been duly approved by the Idaho Water Resources Board, for the purposes of leasing storage water held by the Tribes in American Falls Reservoir for delivery and use in the Snake River Basin anywhere within Idaho, and for leasing storage water held by the Tribes in Palisades Reservoir for delivery and use in the Snake River Basin above Milner Dam.

C. The Districts are members of the Idaho Ground Water Appropriators, Inc. ("IGWA") which has entered into an agreement with the Surface Water Coalition to resolve disputes related to the impacts of groundwater use on surface water rights. The Districts desire to lease storage water from the Tribes based on the terms herein for use in meeting aspects of that agreement.

AGREEMENT

Now, therefore, and in consideration of the covenants and obligations set forth herein, and for other good and valuable consideration, the Tribes and Districts agree as follows:

1. **Leased Water.** The Tribes will provide to the Districts, and the Districts will rent from the Tribes, a volume of 10,000 acre-feet (the "Lease Volume"), subject to the following terms and conditions:

   1.1 The Lease Volume will be supplied from the Tribal Water Supply Bank. Water available for the Lease Volume excludes all other water rights and water assets of the Tribes, and such water rights and assets are not a part of this Lease Agreement.

   1.2 The Tribes hold a "Reserve Supply" equal to 25,276 acre-feet that was secured under a 2015 settlement agreement. The Tribes may request delivery of the Reserve Supply each year up to an annual volume of 10,000 acre-feet to be administered as Tribal storage allocation in American Falls Reservoir. The Tribes, in their sole discretion, may elect to use the Reserve Supply to fulfill Lease Volume commitment defined in Section 1 above. The Reserve Supply will be provided through the Tribal Water Supply Bank.

2. **Water Delivery and Administration.** Delivery of the Lease Volume shall occur when the Lease Volume has been released from either Palisades or American Falls Reservoir, and appropriately deducted from the Tribes' storage account in these reservoirs. The Tribes and Districts shall cooperatively work together to ensure the delivery of the Lease Volume to the Districts and the appropriate administration of such water.

   2.1 The quantity of water to be leased under this Lease Agreement under Paragraph 1 will be reviewed by the Tribal Rental Pool Committee as required by the Shoshone-Bannock Tribal Water Supply Bank Rules.

   2.2 Any carriage or other losses of Lease Volume that may occur downstream from American Falls Reservoir or Palisades Reservoir shall be the responsibility of the Districts.

   2.3 The scheduling of releases of the Lease Volume shall be in the sole discretion of the Districts; provided however, that the Districts will notify and cooperate with the Tribes and the U.S. Bureau of Reclamation (Reclamation) to implement any storage release request. The Tribes and Districts will cooperate with Reclamation and Water District 1 in measuring and accounting for the Lease Volume at the outflow of American Falls Reservoir and/or Palisades Reservoir.

   2.4 The Lease Volume shall only be available for use by the Districts or assignment to the Surface Water Coalition to satisfy IGWA's obligations and shall not otherwise be available for re-marketing or assignment to a third party, unless such re-marketing or assignment is agreed to in writing by the Tribes.

3. **Term.** The term of this Lease Agreement shall be for one (1) year commencing April 1, 2023, and terminating on October 31, 2023.

4. **Agreement Contingencies.** This Lease Agreement, and all obligations hereunder, are expressly contingent upon:

   4.1 Payment by the Districts pursuant to Section 5 below;

   4.2 Delivery of the Lease Volume by the Tribes to the Districts prior to October 31, 2023, subject to the provisions of Paragraphs 5-7 below.

5. **Payment.** The "Lease Payment" shall be [redacted]. The Districts shall be obligated to make the Lease Payment whether or not the Districts take delivery of any amount of the Lease Volume by October 31, 2023. Provided, however, that if the Tribes are unable to make available for delivery the full Lease Volume, the Districts shall pay [redacted] per acre foot of water the Tribes make available for delivery.

6. **Payment Schedule.** The Lease Payment shall be payable by the Districts as follows:

   6.1 50% of the Lease Payment is due by July 15, 2023;

   6.2 The balance of the Lease Payment is due by November 1, 2023;

   6.3 All payments are payable by wire transfer to the Tribes within five (5) business days of due date stated above.

7. **Termination.** Either the Tribes or the Districts may terminate this Lease Agreement in accordance with the provisions below:

   7.1 The Tribes or Districts may terminate this Lease Agreement:

   (a) For any uncured violation or breach of the terms of this Lease Agreement; or

   (b) If any of the terms and conditions of any approval of the lease arrangement, or other applicable state or federal law, rule, or regulation, or the administration of the leased water, are inconsistent with the terms of this Lease Agreement.

   7.2 Termination shall be effective within 30 days of provision of written notice to the other party detailing the basis for such termination. The party against whom such termination is asserted shall have 30 days to cure the violation or breach that is the basis for the termination.

   7.3 Termination may be subject to the Conflict Resolution provisions of Section 10 if the party against whom termination is sought disagrees with the basis of the termination.

   7.4 In the event of any such termination, there shall be an accounting of the Lease Payment paid by the Districts and the Lease Water delivered by the Tribes as of the termination date. The Districts shall pay for all Lease Water delivered. If the Districts have submitted payment for Lease Water that remains undelivered by the termination date, the Tribes shall refund the portion of the Lease Payment received for water that remains undelivered, and the Tribes will not be obligated to provide such water unless the parties otherwise agree in writing.

8. **Miscellaneous Provisions.**

   8.1 Amendments. No amendment or modification of this Lease Agreement or its provisions shall be effective unless documented in writing and approved and executed by all parties with the same formality as this Lease Agreement.

   8.2 Force Majeure. Delays or inability to perform any of the requirements of this Lease Agreement within the term or time limits prescribed herein shall be excused to the extent that performance is rendered impossible by any event beyond the control of either party including but not limited to drought, governmental acts or orders or restrictions, war, terrorism or any other reason where failure to perform is beyond the reasonable control of and is not caused by the conduct of the non-performing party. A force majeure event shall not include financial inability to complete performance of an obligation.

   8.3 Notices. All notices and other communications under this Lease Agreement shall be in writing. Notices shall be deemed as duly received on the date of service, if served personally on the party to whom notice is to be given. Notices sent by mail shall be deemed as duly received five (5) days from the date said notice is mailed to the party to whom notice is to be given, either by first class mail, registered or certified, postage prepaid or by express delivery with handling prepaid. Notices sent by email shall be deemed delivered when the intended recipient acknowledges receipt via reply email. Either party may change its address for notices by sending written notice to the other party in accordance herewith. Notices shall be addressed as follows:

If to the Shoshone-Bannock Tribes:

Chairman, Fort Hall Business Council
Shoshone-Bannock Tribes

Racine Olson
201 E. Center Street
Pocatello,ID 83204
(208) 232-6101
tj@racineolson.com

9. **Compliance with Laws and Usage.** The parties, at their own expense, will comply with all federal, state, and tribal laws, ordinances, rules, and regulations applicable to this Lease Agreement and the business conducted pursuant thereto.

10. **Conflict Resolution.** In the event of any dispute, claim, question, or disagreement arising from or relating to the Lease Agreement or the breach thereof, the Tribes and Districts agree as follows:

    (a) The parties will initially engage in good faith negotiation in an attempt to resolve the conflict cooperatively.

    (b) If the conflict is not resolved to the satisfaction of either party through good faith negotiation, the parties agree to submit such dispute to non-binding mediation in an effort to resolve the same.

    (c) If formal legal proceedings are commenced in connection with this Lease Agreement, the parties agree that the Shoshone-Bannock Tribal Court shall be the sole, proper, and exclusive forum and venue for such proceedings.

(d) The laws and regulations of the Shoshone-Bannock Tribes shall govern the interpretation of this Lease Agreement and/or any formal legal proceedings commenced regarding this Lease Agreement.

11. **Attorneys' Fees.** In any action concerning the interpretation or enforcement of this Lease Agreement, the prevailing party shall be entitled to recover reasonable costs and attorneys' fees and costs incurred, including any costs and attorneys' fees incurred in appellate proceedings.

12. **Binding Effect.** All of the covenants, conditions, and provisions of this Lease Agreement shall inure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

13. **Entire Agreement.** This Lease Agreement constitutes the entire agreement between the parties and supersedes any prior understandings or oral or written agreements between the parties respecting the subject matter hereof.

14. **Severability.** If any provision of this Lease Agreement is held to be invalid or unenforceable, such invalidity or unenforceability shall not affect any other provision of this Lease Agreement, and such other provisions shall continue in full force and effect, unless Sections 1, 5 or 6 are held to be invalid or unenforceable.

15. **Headings.** The headings of paragraphs and sections in this Lease Agreement are inserted only as a matter of convenience and for reference purposes, and they do not define, limit, or describe the scope of this Lease Agreement or the intent of any of the provisions thereof.

16. **Sovereign Immunity.** Neither the execution of this Lease Agreement, nor any provision contained herein shall be interpreted to act as a waiver of the Shoshone-Bannock Tribes' sovereign immunity. The Shoshone-Bannock Tribes hereby specifically reserves and retains its sovereign immunity and any rights appurtenant thereto. The Shoshone-Bannock Tribes' sovereign immunity from suit may only be waived by resolution of the Fort Hall Business Council.

17. **Contract Interpretation.** The parties have participated jointly in the negotiation and drafting of this Lease Agreement. If an ambiguity or question of intent or interpretation arises, this Lease Agreement shall be construed as if drafted jointly by the parties and no presumption or burden of proof shall arise favoring or disfavoring any party by virtue of the authorship of any of the provisions of this Lease Agreement.

18. **No Third-Party Beneficiary.** This Lease Agreement is exclusively for the benefit of and governs only the parties hereto. The Tribes and Districts are the only parties to this Lease Agreement and are the only parties entitled to enforce the terms of this Lease Agreement. Nothing in this Lease Agreement gives, or is intended to give, or shall be construed to give or provide any benefit or right, whether directly, indirectly or otherwise, to third persons.

19. **Indemnification.** The Districts indemnify the Tribes and its officers, subsidiaries, agents, and employees (the "Indemnitees") and the Districts shall hold the Indemnitees harmless for any damages, claims, demands, personal injury, illness, death, property damage, or other loss resulting in any manner in connection with the Districts' use of the water leased pursuant to this Lease Agreement.

20. **No Waiver.** Forbearance in enforcing any right or remedy under this Lease Agreement shall not be deemed a wavier nor shall it be the basis for an inference that any party hereto has waived any provision hereof or that a party has waived any right hereunder.

January 5, 2023

This Lease Agreement shall be effective when signed by both the Tribes and the Districts.

RESOLUTION

WHEREAS, the Fort Hall Business Council has the ultimate responsibility for budget approvals and overseeing the administration of all Tribal funding as well as those funds awarded to the Shoshone-Bannock Tribes through contracts, grants and cooperative agreements, regardless of the source; and

WHEREAS, the Tribal Water Bank was established for the benefit of the Shoshone-Bannock Tribes, pursuant to the "1990 Fort Hall Indian Water Rights Agreement", that utilizes the Tribes' contract storage rights in the American Falls and Palisades Reservoirs; and

WHEREAS, in 2015 the Tribes negotiated a Settlement Agreement for 25,276 acre-feet of storage water with the Committee of Nine for impacts that the Water District 01 Common Rental Pool had to the Tribes' storage supplies, of which 15,276 acre-feet is available and 10,000 acre-feet can be used annually; and

WHEREAS, three water districts: North Snake Ground Water District, Magic Valley Ground Water District and the American Falls-Aberdeen Ground Water District (Districts) have applied to rent 10,000 acre-feet of storage water for one-year from the Tribal Water Bank; and

WHEREAS, the Tribes have an adequate supply for 2023 to provide an additional 10,000 acre-feet of storage water; and

WHEREAS, the Tribal Water Resources Department (TWRD) is recommending that the Tribes' enter into a one-year Tribal lease agreement with the Districts for 10,000-acre feet; now

THEREFORE, BE IT RESOLVED BY THE BUSINESS COUNCIL OF THE SHOHONE-BANNOCK TRIBES, that the Tribal Water Resources Department is hereby approved to enter into one-year Tribal lease agreement with the North Snake Ground Water District, Magic Valley Ground Water District and the American Falls-Aberdeen Ground Water District for a 10,000 acre-feet at a rate of [redacted] dollars per acre-feet; and

BE IT FURTHER RESOLVED, that monies derived from this one-year Tribal lease agreement will be utilized to assist with costs associated with monitoring programs, water projects and TWRD costs towards the implementation and administration of the "1990 Fort Hall Indian Water Rights Agreement"; and

BE IT FURTHER RESOLVED, that the Tribal Chairman or official designee is authorized to sign the one-year Tribal lease agreement between the Tribes and the water districts: North Snake Ground Water District, Magic Valley Ground Water District, and the American Falls-Aberdeen Ground Water District; and

BE IT FURTHER RESOLVED, that the Interim TWRD Director is authorized to sign a letter to Water District 01 and Committee of Nine stating that the Tribes are electing to use 10,000 acre-feet of Settlement Water for 2023, if necessary.

Authority for the foregoing resolution is found in the Indian Reorganization Act of June 18, 1934 (48 Stat., 984), as amended, and in the Shoshone-Bannock Tribes Constitution and Bylaws of the Fort Hall Reservation, as amended, including, but not limited to the authority found in the Constitution, Article VI.

Dated this 31st day of January 2023

Nathan Small

Nathan Small, Chairman
Fort Hall Business Council

S E A L

CERTIFICATION

I HEREBY CERTIFY, that the foregoing resolution was passed while a quorum of the Business Council was present by a vote of 5 in favor, 1 absent (DKT) and 1 not voting (NS) on the date this bears.

Claudia J. Washakie, Tribal Secretary
Fort Hall Business Council

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S POST-HEARING BRIEF**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGAITON DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby submits its post-hearing brief in response to the Director's instructions and request at the close of the administrative hearing held June 6-9, 2023.

The Director held an administrative hearing on the April 21, 2023 *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("*Fifth Order*") (Ex. 300) and the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("*April As Applied Order*") (Ex. 301) on June 6-9, 2023. Various parties had filed requests for hearing and identified statements of issue to be addressed. At the hearing, the Director heard testimony from various lay and expert witnesses and admitted additional exhibits to assist in the review.

At the close of the hearing the Director identified certain questions for the parties to address in post-hearing briefing including:

1) Who bears the burden regarding uncertainty in the information presented (i.e. IDWR, seniors, juniors)?
2) What have the courts told us and what are those standards?
3) What is the appropriate due process for this type of hearing?

The Director recognized that this proceeding involves an on-going delivery call and that material injury has already been determined. The Director noted that there is a presumption that a senior water right holder is entitled to water pursuant to its decree and that groundwater pumping in the ESPA depletes flows to the Snake River that supplies the Surface Water Coalition's senior water rights. The Director further noted that the methodology order is the Department's implementation of the conjunctive management rules ("CM Rules") to evaluate water use by the senior and determine whether some adjustment is appropriate pursuant to the "clear and convincing evidence" standard. Finally, due process must take these factors into account. This post-hearing brief addresses those questions in context as well as the updates to the Fifth Order and additional evidence relevant to the April As Applied Order.

I. Burden of Proof in Conjunctive Administration

The Idaho Supreme Court affirmed the burden of proof and evidentiary standard to apply in conjunctive administration cases in *A&B Irr. Dist. v. Spackman*, 153 Idaho 500, 284 P.3d 225 (2012). In that decision the Court held:

> It is Idaho's longstanding rule that proof of "no injury" by a junior appropriator in a water delivery call must be by clear and convincing evidence. Once a decree is presented to an administering agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence.

155 Idaho at 524, 284 P.3d at 224.

The Court also recited the district court's reasoning behind this standard in water right administration which provides further insight into its basis:

> The application of the clear and convincing standard of proof only makes sense from a common sense perspective. If the Director determines that a senior can satisfy the decreed purpose of use on less than the decreed quantity reflected, he needs to be certain to a standard of clear and convincing evidence. In making a determination of whether or not to regulate juniors, the Director is required to evaluate whether the quantity available meets or exceeds the quantity the senior can put to beneficial use. If the Director regulates juniors to satisfy the senior's decreed quantity there is no risk of injury to the senior. However, if the Director regulates juniors to satisfy a quantity less than decreed, there is risk to the senior that the Director's determination is incorrect. There is no remedy for the senior if the Director's determination turns out to be in error and the senior comes up short of water during the irrigation season. **Any burden of this uncertainty should be borne by the junior** . . . [I]f the Director's determination is only based on a finding "more probable than not." The senior's right is put at risk and the junior is essentially accorded the benefit of uncertainty. The requisite high standard accords appropriate presumptive weight to the decree.

155 Idaho at 517, 284 P.3d at 242 (emphasis added).

The above conclusions have guided conjunctive administration in Idaho for well over a decade now. The Director has expressly acknowledged the same in the Fifth Order. *See* Ex. 300 at 33, ¶ 11. The baseline year, its criteria, and subsequent adjustments to in-season demand, take

this standard into account. Therefore, in response to the Director's question it is clear that Idaho courts have placed the burden of "uncertainty" squarely upon junior appropriators for purposes of water right administration. If the Director is unsure as to certain questions, and juniors are going to receive the benefit of out-of-priority diversions, then those juniors must prove defenses by the heightened standard to protect the seniors in times of shortage.

II. Director's Updates to Methodology in the Fifth Methodology Order

The Director first derived the framework for the methodology in the spring of 2010. The original methodology was challenged and litigated through judicial review. *See Memorandum Decision and Order on Petitions for Judicial Review*, Gooding County Dist. Ct., Fifth Jud. Dist., Consolidated Case No. CV-2010-382 (Sept. 26, 2014) ("2014 Order").[1] No party appealed that decision to the Idaho Supreme Court. Since that decision the Director has issued additional updates to the methodology through amended orders. The Fifth Order incorporated new data (2015-2021) not available when the Fourth Order was issued in 2016, and identified the following updates in response.

A. Baseline Year

The methodology's baseline year "is a year or average of years when irrigation demand represents conditions that predict need in the current year of irrigation at the start of the irrigation season." *Fifth Order* at 3, ¶ 7. A baseline year "should represent a year(s) of above average diversions . . . and should also represent a year(s) of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors . . .[and] actual supply should be analyzed to assure that the BLY is not a year of limited supply." *Id.* at 3-4, ¶ 9. The criteria for selecting a baseline year

[1] A full copy of the court's decision is in the record attached as Ex. A to the SWC's *Motion to Limit Scope of Hearing* (June 5, 2023).

has not changed since the Director issued the *Second*, *Third*, and *Fourth Orders*.[2] However, what has changed is the number of years the Director has available to analyze against that criteria. *See Fifth Order* at 11 ("the years 2000-2021 were considered for the BLY selection").

As a result of the updated data, the Director found that "BLY 06/08/12 no longer satisfies the presumption criteria that total diversions in the BLY should exceed the average annual diversions." *Id.* Consequently, the Director concluded that "total diversions for 2018 adequately protect senior water rights when predicting the demand shortfall at the start of the irrigation season and selects 2018 as the BLY." *Id.* at 12, ¶ 27. IDWR staff recommended changing the baseline year to 2018 in its December 23, 2022 staff memorandum. Ex. 914. The Ground Water Users dispute the use of 2018 and the Director's criteria for a baseline year in the methodology. Various positions were advanced advocating for an "average" year of diversions. *See generally*, Exs. 347A; 837A. The use of an "average" year was previously rejected by the District Court:

> The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the Coalition's rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associate with an average year fail to take into account the legal limitations placed on the Director in responding to a delivery call. . . . As set forth above, using data associated with an average year in order to administer to less than the full decreed quantity of the Coalitions' water rights would not meet a clear and convincing evidenced standard. Therefore, the arguments set forth by IGWA and the City of Pocatello are unavailing.

2014 Order at 33-34.

[2] The Director has updated the baseline year before. In 2016, the Director updated the baseline year from the 06/08 average used in the *Second Order* to a new average of 06/08/12 because at that time "the 06/08 diversions are no longer above average." *See Fourth Order* at 11.

The use of 2018 as a baseline year is further supported by the data showing increased water demand in recent years. For example, since 2012 seven out of ten years have experienced below average growing season precipitation. *See Fifth Order* at 4. Over that same period nine out of ten years have experienced above average number of growing degree days. *See id.* at 7. Coupled with increases in higher consumptive use crops like corn and alfalfa, it is clear that the Coalition has witnessed increased water demands from their shareholders and landowners.[3] *See generally* Ex. 1 (pp. 4-9); Ex. 4 (pp. 7-11); *Barlogi Test.* Whereas junior groundwater users have the benefit of a firm water supply every year, it is appropriate to guard against dry and hot conditions for the senior by using the criteria selected by the Director. The 2018 baseline year is only one of two years that fit the methodology criteria and therefore it was appropriate for the Director to update the methodology. *See* Ex. 4 (p. 15).

B. Transient Use of ESPAM

The Eastern Snake Plain Aquifer Model (ESPAM) Version 2.2 has been adopted by the Eastern Snake Plain Hydrologic Modeling Committee (ESHMC) and has been used by IDWR in conjunctive administration, including in response to the Coalition's delivery call. *See* Ex. 3 (p. 3); *see also*, *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 814, 252 P.3d 71, 95 (2011). Although certain consultants raised questions concerning ESPAM 2.2, the juniors did not carry their burden to show that the model is unreliable or cannot be used for conjunctive administration. *See e.g. Final Order* at 24-25 (Docket No. AA-WRA-2021-001) (June 28, 2021) (Director noting that junior ground water users carried the burden to prove by clear and convincing evidence that groundwater model could not be used for administration).

[3] For purposes of the CWN crop mix calculator, IDWR should go back and adjust each year once that data becomes available to ensure the 3-year average is up to date. *See* Ex. 4 (pp. 8-9).

The Director identified how the ESPAM groundwater model has been and can be run to identify a curtailment date for junior groundwater rights causing material injury. *See Fifth Order* at 29-30. If a ground water right is not covered by an approved and effectively operating mitigation plan, then curtailment is the Director's only remedy to prevent material injury to the senior right. *See* CM Rule 40.05.

A steady-state analysis analyzes the impact of curtailment on the aquifer and connected river reaches long-term (i.e. 50 years), whereas a transient analysis predicts the timing of changes that would occur during the irrigation season. *See id.* at 30. The Director acknowledged that only "9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year." *See id.* In other words, if curtailment is based upon a steady-state analysis, it severely under-mitigates a predicted injury to the Coalition's senior water rights. Consequently, the Director adopted a transient analysis as being "necessary to simulate the short-term curtailments prescribed in the methodology."[4] *Id.* at 31.

The Director's transient use of ESPAM 2.2 is appropriate for calculating the in-season reach gains to the Near Blackfoot to Minidoka reach that would result from the curtailment of groundwater pumping. *See* Ex. 3 (p. 3). No expert testified that a steady-state run would fully mitigate the forecasted demand shortfall. The Director's transient use of the model to identify a curtailment date that would mitigate the in-season demand shortfall conforms to judicial precedent on this issue as well. *See Memorandum Decision and Order*, *Rangen, Inc. v. IDWR*, Twin Falls County Dist. Ct., Fifth Jud. Dist., Case No. CV-2014-4970 (June 1, 2015); *Memorandum Decision and Order*, *Rangen, Inc. v. IDWR*, Twin Falls County Dist. Ct., Fifth

[4] Such a finding is consistent with the Director's approval of mitigation plans where he allows the delivery of storage equal to the amount of an injury finding.

Jud. Dist., Case No. CV-2014-2446 (Dec. 3, 2014); *see also*, *Amended Final Order Regarding Compliance with Approved Mitigation Plan* at 17-19 (Docket No. CM-MP-2016-001, Apr. 24, 2023). Stated another way, if junior water users cannot mitigate the predicted in-season demand shortfall, Idaho law does not contemplate curtailment that would only supply between 9-15% of that shortfall during the irrigation season. In sum, the Dirctor's transient use of the model is required by Idaho's prior appropriation doctrine and is supported by the record. If juniors desire to pump out-of-priority and cannot replace the predicted in-season shortfall as required, curtailment must be sufficient to mitigate that shortfall during the irrigation season. A steady-state use of the model does not identify the proper curtailment date for that purpose.

III. Twin Falls Canal Company Water Use / Irrigated Acres

In his ruling following the 2008 hearing, the Hearing Officer (former Chief Justice Gerald Schroder) concluded:

> The evidence does not show substandard facilities for diversion or conveyance. The members of the Surface Water Coalition have improved their conveyance practices since the time the water rights were licensed or decreed. . . .
>
> There are various factors that might be considered that cause difference in the efficiency of diversion and conveyance within the irrigation districts. For example, the North Side Canal Company is very long, requiring more time for water to move from the initial diversion to the end of the system. There will be differences in the amount of evaporation and potentially of conveyance losses. Additionally, if the delivery of water at the beginning of the system is shut off, when the water is again turned on it takes considerable time for water to reach the far end of the system. Damage to the crops may occur during the delay. This simply says that there is no precise formula that can be applied from one SWC member to another. Differences exist. This does not mean that one district is using reasonable facilities and practices and another not. There is no evidence of decayed or damaged systems that are allowed to continue or practices that cause water to be wasted in transit. The evidence in this case indicates that each of the SWC members is operating with reasonable diversion and conveyance efficiency.

R. Vol. 37 at 7101-02.

This finding was echoed by the District Court on judicial review of the first methodology order:

> Furthermore, both the Hearing Officer and the Director found, in considering the Rule 42 factors, that the Coalition members operate reasonable and efficient irrigation projects. The Director found that "as found by the hearing officer in his recommended order, members of the SWC operate reasonably and without waste," and hat he will not "impose greater project efficiencies upon members of the SWC than have been historically realized."

2014 Order at 30-31.

The evidence at the June 6-9, 2023 hearing further showed that the Coalition members continue to operate reasonable and efficient irrigation projects. Specifically, TFCC's manager Jay Barlogi provided testimony about the company's water delivery operations as well as recent maintenance and conservation projects. *See generally*, Ex. 1 (pp. 3-23). Mr. Barlogi noted the increase in consumptive use crops across the project and how changes to sprinkler and residential use have created operational demands within the TFCC system. The company has implemented a number of projects to keep pace with operational demands and continues to look at ways to improve delivery and maintenance of the canal system. In other words, there was no evidence of "decayed or damaged" systems or water being wasted on the TFCC project.

That TFCC continues to put water to beneficial use and use water reasonably was confirmed by Mr. Barlogi as well. Mr. Barlogi described a general overview of operations for the irrigation season which is supported by the Director's previous finding that although crop water needs may vary, water is still put to beneficial use at these times. *See* Ex. 1 (pp. 4-8); *see also Order on Reconsideration of Final Order et al.* at 4, ¶ 16 (June 16, 2010) ("Computing a seasonal Ep that is weighted to monthly CWN is misleading because the computation ignores or dampens the effects of beneficial diversions of water necessary to rear crops that lie beyond simply meeting the consumptive requirement of the plant (i.e. canal charging, availability of a

steady supply of water, chemigation, soil tillage, etc.)"). These beneficial uses were supported by the testimony of the Coalition's experts in evaluating project efficiencies as well. *See* Ex. 4 (pp. 7-13).

Increased consumptive use crops (i.e. corn, alfalfa), as well as double-cropping, have an impact on water demands. *See* Ex. 1 (pp. 7-9); Ex. 4 (pp. 10-11). A review of Water District 01 delivery records confirms that TFCC operates within an accepted acre-feet per acre standard demonstrated by other large open canal systems within the district. *See* Ex. 8. Watermaster Tony Olenichak further testified that it was his opinion that TFCC operated and delivered water in a reasonable manner. *See generally, Olenichak Test.* This opinion was supported by other expert witnesses that testified at the hearing. *See Brockway Test.*, *Shaw Test.* On the other hand, the ground water users did not prove by clear and convincing evidence that TFCC was not putting water that it diverts to beneficial use. Even the exhibit offered by the Cities' consultant showed that measured returns in certain coulees across the TFCC project had remained stable (close to 50,000 acre-feet) and have even decreased over the last three years.[5] *See* Ex. 365.

There was considerable testimony concerning the number of irrigated acres within the TFCC project. The legal status of TFCC's decreed place of use (including the number of authorized acres) and the presumption IDWR must apply is outlined in the Step 1 letter from counsel to Director Spackman dated March 29, 2013. *See* Ex. 938. TFCC submitted an irrigated area shapefile to IDWR in 2013 and since then has sent letters confirming that the acreage has no changed by more than 5% from the prior year.

IDWR staff Matt Anders testified that IDWR previously used 183,589 acres in its irrigated acreage calculations before 2015. *See Anders Test.* This may have been based upon an

[5] The trend is similar for the "tributary gages" which include both natural streamflow and some irrigation return flows during the irrigation season. Certainly the type of water year will influence water availability and the amount of water identified in the flow measurements.

erroneous acceptance of a report presented at the 2008 hearing. *See* Ex. 938 (3/29/13 letter to Director Spackman noting the errors in the 2007 SPF report and fact that it was not adopted by the Hearing Officer). Further, IDWR did not have the benefit of the Court's 2014 Order and confirmation about how the Department must apply the "clear and convincing evidence" standard in conjunctive administration, particularly in application of the methodology.

The Coalition's expert report details issues with the 2017 irrigated lands dataset. *See* Ex. 4 (pp. 1-2). A review of that shapefile overlaid on 2021 aerial imagery shows lands that are irrigated have been removed and classified as "non-irrigated." *See* Ex. 6. Whereas the status of certain lands can change from year to year, and water can be transferred within the TFCC project, identifying exact irrigated acreage in the current year can be a challenge, particularly on a project TFCC's size. With the status of information that it had, IDWR properly relied upon its review of TFCC's 2013 shapefile and the juniors did not carry their burden to show by clear and convincing evidence a different number was justified.

Regardless of the irrigated acreage number and its application in the CWN calculator, a reduction in acreage does not automatically reduce demand or beneficial use of TFCC's water right. TFCC's manager explained that increased consumptive use crops, longer growing seasons, and even double-cropping, have all contributed to increased demands. Ex. 1 (pp. 8-9). Further, conversion to sprinklers have reduced historical returns back to the canal system, reducing water available for reuse. *See id.* (pp. 24-25). Although fewer acres may be irrigated, that would only slightly reduce overall project efficiency and not mean that less water is required for successful canal operations. Ex. 4 (pp. 13-14).

IV. AFRD#2 Baseline Year Diversion Volume

On rebuttal testimony the last day of the hearing (June 9), Matt Anders clarified an error regarding AFRD#2's total diversion volume in 2018. Evaluation of certain recharge water showed that the total volume diverted by AFRD#2 for its irrigation purposes was understated. IDWR should correct the 2018 baseline year data for AFRD#2 accordingly.

V. A&B Surface Water Delivery to Converted Lands / Proportionate Share in April As Applied Order

The April As Applied Order identified A&B's proportionate share of the projected in-season demand shortfall to be 458 acre-feet. *See* Ex. 301 (p. 5, n. 5). This calculation was made using a steady-state run of ESPAM to apportion respective responsibility for the shortfall and mitigation obligation. *See Sukow Test.*

A&B Irrigation District now delivers surface water to 3,576 acres that were formerly solely irrigated with groundwater. *See* Ex. 2. While successful operation of its pipeline requires certain groundwater use for pressurization, the lands are primarily supplied by surface water. It appears that IDWR created the "proportionate share" table using a simulated curtailment of A&B's water rights junior to December 30, 1953. *See April Background Information* (excel spreadsheet).[6] The simulation used a crop irrigation requirement of 2.59 acre-feet per acre and assigns a value of 10,629 acre-feet to the 4,107.9 acres authorized under the District's junior priority water rights (36-15127A et al.). Since A&B has replaced groundwater with surface water delivery on certain lands, that should be taken into account when analyzing the proportionate share of any in-season demand shortfall predicted for the Surface Water Coalition. *See* Ex. 2. In other words, the District is not pumping 10,629 acre-feet for those lands every year as identified in IDWR's background information.

[6] Available at: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/

VI. Non-Participation in Water District 01 Rental Pool.

The Fifth Order notes that "water supplied to private leases or to the rental pool by a SWC member will be included as part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation." Ex. 300 at 13, ¶ 30. Questions arose in 2022 as to whether or not an injured Coalition member could receive an assignment of mitigation storage if that member was not a "participant" in the Water District 01 rental pool. *See SWC Request for Status Conference* at 3-5 (Apr. 27, 2022).

Tony Olenichak provided testimony at the hearing that a Coalition member could receive an assignment of storage water for mitigation purposes even if that member was not a participant in the rental pool. *See Olenichak Test.* The Director should clarify that fact going forward so that if a Coalition member decides to not participate in the rental pool in a given year, that would not preclude assignment of mitigation storage water if necessary, either as part of an approved mitigation plan or for delivery to mitigate injury.

VII. Due Process Concerns Addressed.

Finally, in response to the Director's note at the close of the hearing, while certain parties alleged concerns with the timing of the proceeding and schedules, all parties were subject to the same deadlines. Further, the unique issues related to timely water right administration in this case were explained as follows by the District Court:

> That segues us into issues pertaining to due process. Petitioners raised due process concerns pertaining to the hearing process utilized by the director for the administrative hearing to commence June 6th. In evaluating the due process concerns raised by the petitioners, the Court must be cognizant of the director's duty to timely administer water rights in priority. The Idaho Supreme Court instructed in Musser vs. Higginson that the director's duty to administer water is clear and executive. Time is of the essence in water administration. In any given year the reality is, there is a short timeframe between when water supply determinations can be made and when water users' demands for irrigation water begin. Any process employed by the director must account for the exigencies of

these time constraints. These exigencies were recognized by the drafters of our Constitution as set forth in the Idaho Supreme Court and American Falls Reservoir District Number 2. The Court found the drafters intended that there be no unnecessary delay in the delivery of water pursuant to a valid water right and that a timely response is clearly required when a delivery call is made and water is necessary to respond to that call. That's AFRD Number 2, 143 Idaho at 874. This analysis recognizes the failure of the director to timely administer in priority can result to senior rights in times of shortage. In conjunction, the Idaho Supreme Court further determined that neither the Constitution nor the statutes place any specific time frames on this process.

In this case the record reflects the Department began notifying individuals in September, 2022, that it would be reviewing data used in the Fourth Methodology Order. In November and December, 2022, the Department conducted six meetings regarding possible amendments to the Fourth Methodology Order where staff presented new data and analyses with respect to methodology. Later in December the Department released a document setting forth preliminary recommendations for amendments to the Fourth Methodology Order. The preliminary recommendations stated that the Department will continue to evaluate the integration of these recommendations and others into the methodology. The recommendations also invited outside consultants to submit written comments by January 16, 2023, which some outside experts did by submitting preliminary comments.

On April 21st, 2023, the director issued the Fifth Amended Methodology Order and Final Order regarding the April, 2023, forecast supply. In the final order regarding the April, 2023, forecast supply, the director predicted an in-season demand shortfall to the Twin Falls Canal Company in the amount of 75,200-acre feed. The order gave affected juniors until May 5, 2023, to establish they can mitigate for their proportionate share of the predicted demand shortfall. For those juniors who could not, the order stated that the director would issue a curtailment order.

The director did not hold a hearing prior to issuing the April 21st, 2023, orders. However, he has set a hearing --and he has set a hearing to commence June 6th, 2023, on the orders pursuant to Idaho Code Section 42-1701A(3). Idaho Code Section 42-1701A(3) governs hearings before the director. Subsection 3 applies where the director takes action without a hearing. Normally a party has 15 days to request a hearing under Subsection 3. However, because the director found time was of the essence and because he anticipated multiple parties would request a hearing, he took the proactive step of sua sponte noticing up a hearing to save time. He also set a prehearing conference for April 28th, 2023. The director subsequently denied a request from the petitioners to continue the June 6th hearing until December or January. He also denied a request from the petitioners to appoint an independent hearing officer. On May 2nd, 2023, the director issued a scheduling order, directing that discovery be completed by May 31st, 2023. Then on May 5th, 2023, the director issued an order limiting discovery to preclude questions regarding the director's deliberative process. Okay. Again, on May 2nd, 2023, the director issued a scheduling order, directing that discovery be

> completed by May 31st, 2023. Then on May 5th, 2023, the director issued an order limiting discovery to preclude questions regarding the director's deliberative process on legal and policy considerations. Okay. So in evaluating the process in this case against the director's duty to timely administer water rights in priority, the Court finds it provides due process consistent with the exigencies of the circumstances and the need to administer water in priority to avoid injury to senior rights.
>
> In making this finding, the Court is influenced by the fact that administration in this case arises in the larger context of an ongoing delivery call that has existed since 2005. The director issued its first methodology order in 2010. Since then, the methodology order has been modified and amended three times to account for new data, modeling revisions, and climate trends. So this is not a new issue. And the director gave heads-up that amendments may be required again in 2023, starting in September of 2022, when he notified individuals that the Department was investigating integrating new data techniques into the methodology order. Again, he then conducted a series of meetings, presenting new data and techniques, and issued a preliminary recommendation setting forth proposed amendments and inviting comment from outside experts. In effect, the parties were put on notice starting in September of 2022 that amendments to the methodology order were being considered. Based on prior actions within the context of this ongoing delivery call, parties were also well-aware of the exigent time constraints following demand shortfall predictions. In particular, in its memorandum decision issued on April 11, 2011, in Gooding County Case CV-2010-382, the Court addressed similar due process arguments concerning short timeframes for notice and discovery in the context of this very call. The process provided then was found to provide due process. In this instance the parties are being provided with a hearing on the 2023 orders to commence on June 6th. They were provided approximately six weeks actual notice for the hearing.
>
> In addition, the director began making parties aware that amendments to the methodology order were being considered back in September of 2022. At the hearing on June 6th the parties will be given the opportunity to present evidence and arguments pertaining to the 2023 orders. The Court finds this process provides due process consistent with the exigencies of the circumstances and the director's duty to timely administer water rights in priority. And frankly, setting a hearing after the irrigation season as requested is not a tangible alternative, given the director's duty and the demand shortfall prediction for the 2023 irrigation season.

Transcript, June 1st Hearing, *IGWA et al. v. IDWR*, Ada County Dist. Ct., Fourth Jud. Dist., Case No. CV01-23-8187.

Based upon the above, the parties were provided the necessary due process in this proceeding, and any allegations of the Director violating constitutional rights are unfounded given the unique circumstances regarding conjunctive administration.

CONCLUSION

The Coalition submits the above post-hearing brief on the issues identified.

DATED this 16th day of June, 2023.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **POST-HEARING ORDER REGARDING FIFTH AMENDED METHODOLOGY ORDER**

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") as well as the *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order"). A hearing on these orders was held June 6–9, 2023. In this *Post-Hearing Order Regarding Fifth Amended Methodology Order*, the Director affirms the Fifth Methodology Order with a few modifications. Because there are some modifications, the Director simultaneously issues with this order a *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*.

BACKGROUND

A. General History of the Surface Water Coalition Delivery Call

In January of 2005, various holders of senior priority surface water rights authorizing diversion of water from the Snake River and tributary springs filed or joined in a delivery call against holders of junior priority ground water rights pursuant to the Department's Rules for Conjunctive Management of Surface and Ground Water Resources ("CM Rules"). In response to the delivery call, on May 2, 2005, then-Director Karl Dreher issued an order, which determined that water shortages were reasonably likely in 2005 and would materially injure the holders of senior priority surface water rights. Am. Order at 44, *In re Distribution of Water to Various Water Rights Held By or For the Benefit of A&B Irr. Dist., Am. Falls Reservoir Dist. No. 2, Burley Irr. Dist., Milner Irr. Dist., Minidoka Irr. Dist., North Side Canal Co., & Twin Falls Canal Co.* (Idaho Dep't of Water Res. May 2, 2005).

In response to Director Dreher's order, on August 15, 2005, the holders of senior surface water rights filed a declaratory judgment action in district court, challenging, among other subjects, the constitutionality of the CM Rules. The holders of senior surface water rights requested stays and continuances in a scheduled administrative hearing, and the action for declaratory judgment was heard by the district court. The district court issued its decision on summary judgment on June 2, 2006, finding that the CM Rules were facially unconstitutional.

Order on Pls.' Mot. for Summ. J., at 105, *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, No. CV-2005-600 (Gooding Cnty. Dist. Ct. Idaho June 2, 2006).

The decision by the district court was appealed to the Idaho Supreme Court. On appeal, the Idaho Supreme Court issued an opinion determining that the CM Rules were facially constitutional. *Am. Falls Reservoir Dist. No. 2 v. Idaho Dept. of Water Res.*, 143 Idaho 862, 882–83, 154 P.3d 433, 453–54 (2007).

The Idaho Supreme Court outlined processes for the Director to constitutionally apply the CM Rules and also assigned the burdens borne by the holders of senior surface water rights, junior ground water rights, and the Department. In outlining the acceptable "as-applied" processes, the Idaho Supreme Court stated:

> The [CM] Rules should not be read as containing a burden-shifting provision to make the petitioner re-prove or re-adjudicate the right which he already has . . . . [T]he burden is not on the senior water rights holder to re-prove an adjudicated right. The presumption under Idaho law is that the senior is entitled to his decreed water right . . . .

Am. Falls Reservoir Dist. No. 2, 143 Idaho at 877–78, 154 P.3d at 448–49.

Despite the presumption, the Court stated:

> [T]here certainly may be some post-adjudication factors which are relevant to the determination of how much water is actually needed. The [CM] Rules may not be applied in such a way as to force the senior to demonstrate an entitlement to the water in the first place; that is presumed by the filing of a petition containing information about the decreed right. The [CM] Rules do give the Director the tools by which to determine "how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts [others]." *A & B Irrigation Dist.,* 131 Idaho at 422, 958 P.2d at 579. Once the initial determination is made that material injury is occurring or will occur, the junior then bears the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call.

Id. at 878, 154 P.3d at 449.

After the Idaho Supreme Court's decision in *American Falls Reservoir District No. 2*, then-Director David Tuthill issued an Order appointing retired Idaho Supreme Court Chief Justice Gerald Schroeder to serve as a hearing officer for the administrative hearing. The hearing began on January 18, 2008, and ended February 5, 2008.

On April 29, 2008, Hearing Officer Schroeder issued his decision which recommended among other things that the Director establish a baseline for predicting the water needs of senior surface water users, which was necessary for projecting material injury. *Opinion Constituting*

Findings of Fact, Conclusions of Law and Recommendations at 51. On September 5, 2008, the Director issued his *Final Order Regarding the Surface Water Coalition Delivery Call,* adopting most of the hearing officer's findings and recommendations.

The order was appealed to district court and eventually appealed to the Idaho Supreme Court, which determined the Director had constitutionally "applied" the CM Rules. *In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irr. Dist.,* 155 Idaho 640, 647, 315 P.3d 828, 835 (2013). The Court also held it was proper for the Director to use a baseline year to predict and quantify material injury, and that the initial determination of material injury must depend on "how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts others." *Id.* at 652–53, 315 P.3d at 840 (internal citations and quotations omitted). Finally, the Court affirmed the district court's determination that the clear and convincing evidence standard is to be applied in determining material injury when a decreed senior priority water right is being evaluated for reduction. *Id*.

The Idaho Supreme was clear, however, that because the district court had not reviewed the findings of fact that shaped the methodology nor any modifications to the methodology order, those issues were not properly before the Court. *Id.* at 649, 315 P.3d at 837.

On September 26, 2014, the district court issued its *Memorandum Decision and Order on Petitions for Judicial Review*, wherein Judge Wildman squarely addressed the findings of fact shaping the methodology as well as the modifications to the methodology order. Mem. Decision & Order on Pets. for Judicial Review, *Idaho Ground Water Appropriators, Inc. v. Spackman*, No. CV-2010-382 (Gooding Cnty. Dist. Ct. Idaho Sep. 26, 2014) [hereinafter 2014 District Court Order]. Judge Wildman largely upheld the factual basis underlying the Department's methodology and as-applied orders, but remanded certain portions for further consideration. The groundwater users initially noticed their intent to appeal the 2014 District Court Order, but later filed a motion to withdraw, which the Idaho Supreme Court granted on January 23, 2015. Judge Wildman's 2014 District Court Order will be addressed in detail throughout this order.

B. History of the Fifth Methodology Order

The Director issued the Fifth Methodology Order as well as the 2023 As-Applied Order on April 21, 2023. The Fifth Methodology Order revised the nine steps used to determine material injury to members of the SWC. The 2023 As-Applied Order predicted a shortfall for the 2023 irrigation season, which required appropriators with water rights junior to December 30, 1953, to mitigate or curtail.

Anticipating that one or more parties would request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both orders, the Director issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. The Notice of Hearing scheduled a prehearing conference for April 28, 2023, and an in-person evidentiary hearing on the Fifth Methodology Order and 2023 As-Applied Order for June 6–10, 2023.

Immediately before the April 28, 2023 prehearing conference, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell (collectively the "Cities") filed a *Motion for Continuance* ("Motion to Continue") requesting that the Director continue the June 6–10 evidentiary hearing "until a date in December or January 2024 . . . ." *Motion to Continue* at 8.

During the April 28, 2023 prehearing conference, the Cities presented argument in support of their Motion to Continue. The Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Groundwater District ("BJGWD"), and McCain Foods orally moved to join the Cities' Motion to Continue. The Cities requested that the hearing, currently scheduled for June 6–10, 2023, be delayed approximately six months. *Motion to Continue* at 8. The Cities asserted additional time was needed to conduct discovery, prepare witnesses, properly evaluate the updated Fifth Methodology Order and 2023 As-Applied Order, and because one of its attorneys (Ms. Candice McHugh) would be unable to appear in person June 6–10. *Id*. at 4–6. The Cities further asserted the Director should grant its request because no exigency exists given the above-average snowfall this year. *Id*. at 6–8. The SWC opposed the Cities' motion, arguing the hearing should remain as scheduled on June 6–10, 2023.

The Director orally denied the Cities' request to continue the hearing until December or January 2024. The Director stated he was, however, willing to hold the hearing anytime within the first three weeks of June 2023 so long as all parties agreed to the modified dates. In denying the Cities' requested continuance, the Director emphasized his court-ordered obligation to timely predict water supplies and issue orders to ensure senior water right holders are protected.

On May 5, 2023, the Director issued an *Order Denying the Cities' Motion for Appointment of Independent Hearing Officer and Motion for Continuance and Limiting Scope of Depositions* ("Order Denying Motion to Continue & Limiting Scope of Depositions"). In the order, the Director memorialized his oral denial of the Motion to Continue, but reiterated he was willing to move the hearing within the first three weeks of June 2023, so long as the parties filed a stipulated motion requesting the change. *Order Denying Motion to Continue & Limiting Scope of Depositions* at 2. The Director also ordered that the depositions of Department staff be limited "to preclude questions regarding the Director's deliberative process on legal and policy considerations" pursuant to IDAPA 37.01.01.521. *Id*. at 3. By separate order, the Director authorized Ms. McHugh to appear at the hearing remotely. Scheduling Order & Order Authorizing Remote Appearance at Hr'g at 3.

On May 5, 2023, the Cities, along with IGWA, BJGD, and Bingham Groundwater District (collectively the "Groundwater Users") filed a *Motion for Reconsideration of Denial of Continuance* ("Motion to Reconsider") requesting that the Director reconsider his order denying the Groundwater Users' request to continue the hearing. The Groundwater Users further argued that the June 6–10 hearing should be continued due to the unavailability of numerous witnesses and an attorney. *Motion to Reconsider* at 3–5. The Groundwater Users also claimed that a failure to continue the hearing would result in prejudice to the Groundwater Users. *Id.* at 5.

On May 8, 2023, the SWC filed *Surface Water Coalition's Opposition to Groundwater Users' Motion for Reconsideration of Order Denying Motion for Continuance* ("Objection to

Motion to Reconsider"). The SWC pointed out that the Department has already authorized Ms. McHugh to appear remotely to accommodate her travel, and that the SWC would stipulate to IGWA's expert witnesses, Sophia Sigstedt's, appearing remotely to accommodate her medical condition. *Objection to Motion to Reconsider* at 8–9 n.8. The SWC further argued that 6 weeks was plenty of time to prepare for a hearing, as evidenced by the fact that the First Methodology Order in this exact case was issued on April 7, 2010, with an evidentiary hearing held approximately six weeks later on May 24, 2010. *Id.* at 7–8. The SWC further argued that this type of scheduling in a conjunctive management administration should surprise no one. *Id*. Most importantly, the SWC argued they would be prejudiced were the hearing to be continued. *Id.* at 10.

On May 19, 2023, the Director issued his *Order Denying Motion for Reconsideration of Denial of Continuance* ("Order Denying Motion to Reconsider"). In denying the Groundwater Users motion, the Director expressed that, like the SWC, he was skeptical of the Groundwater Users contention that they had secured sufficient mitigation to ensure seniors would not be injured. *Order Denying Motion to Reconsider* at 5–6. The Director further emphasized his legal responsibility to timely respond to injury incurred by senior water users. *Id.* at 6 (citing *Am. Falls Reservoir Dist. No. 2,* 143 Idaho at 874, 154 P.3d at 445).

Also on May 19, 2023, the Cities, BJGWD, Bingham Groundwater District ("BGWD"), and McCain Foods filed in district court a *Complaint for Declaratory Relief, Petition for Writ of Prohibition, and Petition for Writ of Mandamus* ("Complaint & Petition") as well as a motion for order to show cause. On the same day, IGWA filed in district court a petition for judicial review along with a variety of motions including a motion to stay, a motion for injunctive relief, motion to compel, motion for order to show cause, and a motion for expedited decision. The purpose of the Groundwater Users' various petitions and motions was the same; they were an attempt to persuade the district court to step in and stop the administrative hearing set for June 6–10, 2023.

On June 1, 2023, the district court held a 3.5-hour hearing on the Ground Water Users' various petitions and motions. At the conclusion of the hearing the court ruled from the bench and orally dismissed the Cities writ applications and IGWA's petition for judicial review, and also denied the various other motions filed by the Groundwater Users.[1] The court reiterated that the Groundwater Users grievances have already been addressed in numerous previous cases:

> And I'm going to add one final conclusion here. You know, after reviewing the issues raised in these cases and preparing for these hearings, as I had mentioned earlier, I went back and reviewed the numerous opinions that have been addressed by this Court where substantially the same if not the same issues were raised in the context of conjunctive management delivery calls, including this same delivery call brought by the Surface Water Coalition. The issues are not new, and my reading of the prior decisions explicitly sets forth and reiterates the overriding principles that govern these types of matters. And I'm aware in every single one of those, parties attempt to distinguish that particular set of circumstances to justify the requirement

[1] On June 7, 2023, the Cities filed a motion to voluntarily dismiss their remaining complaint for declaratory relief, which the district court granted on June 14, 2023.

> of exhausting administrative remedies. But the issues raised -- and based on my review, the issues raised today in these cases are no different. And these include that the director's statutorily charged with administering water in priority; time is of the essence in responding to delivery calls; the director must act quickly to avoid injury to senior rights; due process is required but must account for the exigencies of the circumstances; the director has discretion in limiting the scope and timing of the hearings; and unless a statute or rule otherwise provides for a hearing, the director may issue an order and conduct a hearing after issuance of the order.

Excerpt from Hr'g on Admin. Appeals (Court's Ruling) Tr., at 11–12, *City of Pocatello v. Idaho Dep't of Water Res.*, No. CV01-23-08258 (Ada Cnty. Dist. Ct. Idaho June 1, 2023).

The previously scheduled administrative hearing began on June 6, 2023. The hearing was scheduled for five days but was completed in four. Prior to the hearing, the Department posted to its publicly available website the materials Department staff might rely upon at the hearing. The Director took official notice of the documents as authorized under the Department's Procedural Rule 602 (IDAPA 37.01.01.602). At the conclusion of the hearing, the Director requested that the parties submit post-hearing briefing by June 16, 2023. The parties submitted post-hearing briefs.

APPLICABLE LAW

1. "The agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); IDAPA 37.01.01.600.

2. The conjunctive management rules "give the Director the tools by which to determine 'how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts . . . other sources.'" *A & B Irr. Dist. v. Idaho Conservation League*, 131 Idaho 411, 422, 958 P.2d 568, 579 (1997).

3. CM Rule 42.01 lists factors the Director may consider when determining whether senior irrigation water right holders are suffering material injury and using water efficiently and without waste:

> a. The amount of water available in the source from which the water right is diverted.
>
> b. The effort or expense of the holder of the water right to divert water from the source.
>
> c. Whether the exercise of junior-priority ground water rights individually or collectively affects the quantity and timing of when water is available to . . . a senior-priority surface . . . water right. This may include the seasonal as well as the multi-year and cumulative impacts of all ground water withdrawals from the area having a common ground water supply.

d. If for irrigation, the rate of diversion compared to the acreage of land served, the annual volume of water diverted, the system diversion and conveyance efficiency, and the method of irrigation water application.

e. The amount of water being diverted and used compared to the water rights.

f. The existence of water measuring and recording devices.

g. The extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices; provided, however, the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years. In determining a reasonable amount of carry-over storage water, the Director shall consider the average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system.

h. The extent to which the requirements of the senior-priority surface water right could be met using alternate reasonable means of diversion or alternate points of diversion, including the construction of wells or the use of existing wells to divert and use water from the area having a common ground water supply under the petitioner's surface water right priority.

IDAPA 37.03.11.042.01

4. The Rule 42.01 factors are not comprehensive. The following are additional factors the Director has considered:

- Statistical Certainty for Predicting Water Supply (Regression r^2 values)
- Field Headgate Deliveries (3/4 inch/acre vs. 5/8 inch/acre)
- Model Uncertainty
- Futile Call
- Trim Line

5. CM Rule 43.03.c outlines a variety of factors the Director may consider in determining whether a proposed mitigation plan will prevent injury to senior rights:

Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right when needed during a time of shortage even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi season accounting of ground water withdrawals and provide for replacement water

> to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.03.11.043.03.c.

6. "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence." *A & B Irr. Dist. v. Idaho Dep't of Water Res*., 153 Idaho 500, 524, 284 P.3d 225, 249 (2012).

7. "If the Director is going to administer to less than the full amount of acres set forth on the face of the [SWC's] Partial Decrees, such a determination must be supported by clear and convincing evidence." *2014 District Court Order* at 19.

8. Clear and convincing evidence is evidence indicating that the thing to be proved is "highly probable or reasonably certain*." In re Doe*, 157 Idaho 694, 699, 339 P.3d 755, 760 (2014).

9. "It seems self–evident that to divert water from a stream or its supplies or tributaries must in a large measure diminish the volume of water in the main stream, and, where an appropriator seeks to divert water on the grounds that it does not diminish the volume in the main stream or prejudice a prior appropriator, he should . . . produce clear and convincing evidence showing that the prior appropriator would not be injured or affected by the diversion. The burden is on him to show such facts." *Josslyn v. Daly*, 15 Idaho 137, 149, 96 P. 568, 571–72 (1908) (internal citations and quotations omitted).

10. The Idaho Supreme Court has expressly admonished that, if the Director is going to administer to less than the full amount of the decree, the burden of any uncertainty must be borne by junior water users:

> In making a determination of whether or not to regulate juniors, the Director is required to evaluate whether the quantity available meets or exceeds the quantity the senior can put to beneficial use. If the Director regulates juniors to satisfy the senior's decreed quantity, there is no risk of injury to the senior. However, if the Director regulates juniors to satisfy a quantity less than decreed, there is risk to the senior that the Director's determination is incorrect. There is no remedy for the senior if the Director's determination turns out to be in error and the senior comes up short of water during the irrigation season. Any burden of this uncertainty should be borne by the junior. . . . [I]f the Director's determination is only based on a finding "more probable than not." The senior's right is put at risk and the junior is essentially accorded the benefit of uncertainty. The requisite high standard accords appropriate presumptive weight to the decree.
> . . . .
>
> It is Idaho's longstanding rule that proof of "no injury" by a junior appropriator in a water delivery call must be by clear and convincing evidence. Once a decree is

> presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence.

A & B Irr. Dist., 153 Idaho at 524, 284 P.3d at 249 (internal citations and quotations omitted).

11. In responding to a delivery call under the CM Rules, the Director "may employ a baseline methodology as a starting point for considering material injury," provided the baseline methodology otherwise comports with the prior appropriation doctrine as established by Idaho law. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841; *see also 2014 District Court Order* at 17.

12. In his 2014 District Court Order, Judge Wildman stated:

> The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the [SWC's] rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associated with an average year fail to take into account the legal limitations placed on the Director in responding to a delivery call . . . .
> . . . .
>
> If the Director determined the needs of the [SWC] based on historic use data associated with an average year, any decision to administer to less than the full quantity of the [SWC's] decreed rights based on that data would not adequately protect its senior rights. Using data associated with an average year by its very definition would result in an under-determination of the needs of the [SWC] half of the time. The Director simply cannot rely upon such data if he is going to administer to less than the decreed quantity of the [SWC's] water rights as his analysis would not be supported by clear and convincing evidence.
> . . . .
>
> As set forth above, using data associated with an average year in order to administer to less than the full decreed quantity of the [SWC's] water rights would not meet a clear and convincing evidenced standard. Therefore, the arguments set forth by IGWA and the City of Pocatello are unavailing.

2014 District Court Order at 34.

13. Throughout the 2014 District Court Order, Judge Wildman analyzed and applied the Rule 42.01 factors referenced above and reiterated that the proper evidentiary standard is clear and convincing evidence and that the junior ground water users bear the burden of proof.

a. Reduction of Decreed Place of Use: (See Rule 42.01.d.)

Regarding a reduction of the decreed place of use (Rule 42.01.d), Judge Wildman stated:

> If the Director is going to administer to less than the full amount of acres set forth on the face of the [SWC's] *Partial Decrees,* such a determination must be supported by clear and convincing evidence. *See. e.g., A&B Irr. Dist., v. Idaho Dept. of Water Res.,* l53 Idaho 500, 524,284 P.3d 225, 249 (holding, "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence").

2014 District Court Order at 19.

b. Efficiency and Waste of Water (see Rule 42.01 preface and Rule 42.01.f–g):

Regarding efficiency and the waste of water (Rule 42.01 preface and Rule 42.01.f–g), Judge Wildman stated:

> [I]f the junior users believe for some reasons that the seniors will receive water they cannot beneficially use, it is their burden under the established evidentiary standards and burdens of proof to prove that fact by clear and convincing evidence. For example, the juniors may assert that the Director in their opinion is considering some, but not *all* acres that are no longer irrigated by the seniors. Or it may be their opinion that the Director is considering some, but not *the full extent* of water diverted by the seniors for use by others. In that scenario, it is then their burden under the established evidentiary standards and burdens of proof [to] get evidence supporting their position before the Director in an appropriate fashion.
> . . . .
>
> If junior users believe that administering to the full decreed amount of the [SWC's] water rights will result in waste, they must come forth with clear and convincing evidence establishing that fact. *A&B lrr. Dist.,* 153 Idaho at 524, 284 P.3d at 249.

2014 District Court Order at 31, 45 (emphasis in original).

c. Transactions of Surface Water that Could Diminish Senior Water Right Entitlement (see Rule 42.01.e):

Regarding transactions of surface water that could diminish senior water right entitlements (Rule 42.01.e), Judge Wildman stated:

> The fact that such transaction may have occurred is not . . . sufficient if the Director is going to use that data to administer to less than the full amount of the Coalition's decreed rights. *A&B Irr. Dist.,* 153 Idaho at 524, 284 P.3d at 249 (holding, "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence").

2014 District Court Order at 46–47.

d. Acres irrigated with supplemental ground water rights:

When determining total irrigated acreage, the Department may consider supplemental groundwater use. *Fifth Methodology Order* ¶ 23, at 10, ¶ 1, at 40.

Regarding supplemental acres, Judge Wildman stated:

> If it is established that acreage accounted for under the Coalition's senior surface water rights is being irrigated from a supplemental ground water source, that is a factor the Director has the authority to consider in the context of a delivery call. If the supplemental ground water rights being used are themselves subject to curtailment under the senior call, (as suggested may be the case here by the Hearing Officer), that factor should also be accounted for by the Director.

2014 District Court Order at 18 (internal citations and quotations omitted).

ANALYSIS

A. Hydrologic connectivity.

1. Groundwater in the ESPA is hydrologically connected to the Snake River

Rule 42.01.c authorizes the Director to determine whether pumping by junior ground water appropriators is affecting downstream senior surface water users. IDAPA 37.03.11.042.01.c; *see also Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 878, 154 P.3d at 449. The conjunctive management rules "give the Director the tools by which to determine 'how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts others.'" *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 878, 154 P.3d at 449 (quoting *A & B Irrigation Dist*., 131 Idaho at 422, 958 P.2d at 579).

The evaluation of the hydraulic relationship between ground water and surface water, and whether, because of an established relationship, pumping from ground water will deplete the source of water upon which the holders of senior priority surface water rights depend is not a proposed change to the decree. *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 877, 154 P.3d at 448.

The hydraulic relationship between ground water and surface water has been established in previous proceedings in this matter by expert testimony. "The surface and ground waters in the Snake River Basin are hydraulically connected, such that ground water pumping can decrease the natural flows in the Snake River and its tributaries." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist*., 155 Idaho at 643, 315 P.3d at 831. "[G]eneral interconnection of all water in the Snake River system is well settled . . . unless the

party claiming otherwise proves by a preponderance of the evidence that the water is from a separate source." *A & B Irr. Dist.*, 131 Idaho at 421–22, 958 P.2d at 578–79. A general provision was added to each water basin in the ESPA, advising that all water rights in the Snake River Basin are connected sources to the Snake River and shall be administered conjunctively unless otherwise specifically provided.[2]

2. Quantifying Depletion

Quantifying the magnitude of the depletion caused by ground water pumping is not a change to the decree. *A & B Irr. Dist. v. Idaho Dep't of Water Res.*, 153 Idaho 500, 523, 284 P.3d 225, 248 (2012). These hydraulic relationships must be established by the preponderance of evidence, as a prerequisite, if possible, to any attempt to adjust the elements of a decreed water right.

The magnitude of the depletion on the Near Blackfoot to Minidoka Reach has previously been quantified by various ground water models for the Eastern Snake Plain Aquifer, although the magnitude of depletion on the reach has fluctuated for each new version of the ground water model. Differences in the predictions result from differences in the methods and time periods used to quantify irrigated acres, evapotranspiration, and consumptive use of ground water, along with improvements in the model representation of the near Blackfoot to Minidoka reach and changes in calibrated model parameters. Off. Noticed Doc. CurtScen22_FinalwApp, at 8, 17.[3] In ESPAM versions 1.1, 2.1, and 2.2, predictions of the depletion to the near Blackfoot to Minidoka reach caused by ground water pumping within the model boundary have ranged from approximately 860,000 to 1.2 million acre-feet per year. The predicted depletions to the near Blackfoot to Minidoka reach ranged from 42% to 46% of the modeled volume of ground water use. All three versions of the model have quantified a significant depletion to the near Blackfoot to Minidoka reach resulting from ground water pumping. Off. Noticed Doc. CurtScen22_FinalwApp, at B-2; Off. Noticed Doc. iwdl-200601, at 22.[4]

In 2022, ESPAM 2.2 predicted that the long-term junior ground water pumping within the ESPA area of common ground water supply depletes reach gains in the near Blackfoot to Minidoka reach by approximately 1.1 million acre-feet per year. Ex. 318, at 13, 21.

3. Quantifying Material Injury

Predicting and documenting whether the depletion caused by groundwater pumping is reducing the delivery of senior surface water rights is difficult because the seniors' Snake River

---

[2] *See* SRBA General Provisions for Basins 01, 21, 22, 23, 24, 25, 27, 29, 31, 35, 36, 41, 43, 45, and 47, access at: https://idwr.idaho.gov/water-rights/adjudication/srba/documents/ (last visited June 29, 2023).

[3] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: ESPAM Report\ESPAM22_Reports\Scenarios\ CurtScen22_FinalwApp.

[4] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathways: ESPAM Report\ESPAM22_Reports\Scenarios\ CurtScen22_FinalwApp; ESPAM Report\ESPAM_Legacy_Reports\ iwdl-200601.

water supply relies on both ground water inflow (aquifer discharge entering the Snake River), as well as surface water inflow (snowpack runoff into the Snake River). Predictions of material injury must therefore include a combination of surface water runoff forecasts and surrogate ground water data for estimating ground water inflow to the Snake River.

Because of the variability in Snake River runoff and aquifer levels, the evaluation of whether ground water pumping depletions reduce the delivery and beneficial use of senior water right entitlements must be completed annually. As a result, the methodology order must simultaneously analyze the annual hydrologic data to: (1) determine whether reduced aquifer discharge to the Snake River caused by ground water pumping will result in a demand shortfall for senior water rights given the forecasted snowmelt runoff; and (2) evaluate possible reductions of senior water right elements under the clear and convincing evidence standard. Because these evaluations are concurrent in the methodology order, the Director employs safety factors when considering data that might adjust elements of the decreed senior water rights. As addressed in more detail below, these safety factors are necessary to ensure any adjustment to senior decreed water rights satisfy the requirement for clear and convincing evidence.

B. Challenges to the Fifth Methodology's Order's Method for Calculating Shortfall

Once the prerequisite hydrologic relationships have been established, the presumption is that the holder of the senior priority water right is entitled to delivery and beneficial use of the decreed water right elements, and any diminishment of the decreed elements must be proven by clear and convincing evidence. *A & B Irr. Dist*., 153 Idaho at 524, 284 P.3d at 249 (Holding that "[o]nce a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence."). "If the Director is going to administer to less than the full amount of acres set forth on the face of the Coalition's Partial Decrees, such a determination must be supported by clear and convincing evidence . . . ." *2014 District Court Order*, at 19. "It is Idaho's longstanding rule that proof of 'no injury' by a junior appropriator in a water delivery call must be by clear and convincing evidence." *A & B Irr. Dist.*, 153 Idaho at 524, 284 P.3d at 249.

1. Baseline Year

A baseline year is a year or average of years when irrigation demand represents conditions that can predict need in the current year. The predicted irrigation demands of the current irrigation season are derived from the baseline year and are compared to estimated water supplies to predict material injury to senior appropriators. *Fifth Methodology Order* ¶ 7, at 3. The Idaho Supreme Court has affirmed that data from a baseline year can be used to determine reasonable in-season demand and predict material injury. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist*., 155 Idaho at 653, 315 P.3d at 841.

The baseline year is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) current irrigation practices. *Fifth Methodology Order* ¶ 8, at 3. A baseline year is selected from recent year(s) to ensure the baseline year accurately represents current irrigation practices, recent climate conditions, and a year when the senior water rights received a full supply of waters. *Fifth Methodology Order* ¶ 19, at 9, ¶ 24,

at 11. Because the baseline year data is used to *predict* reasonable in-season demand for senior appropriators, safety factors must be employed to ensure the senior water rights will be satisfied. *See 2014 District Court Order*, at 34. Safety factors include selecting a baseline year(s) with above average diversions, above average temperatures, and below average precipitation. *Fifth Methodology Order* ¶ 9, at 3. These safety factors protect the senior water rights from an underprediction of water need because, under Idaho law, a senior appropriator is presumed entitled to his or her fully decreed water right. *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 877–78, 154 P.3d at 448–49.

In previous methodology orders, no single year during the period from 2000–2014 satisfied all necessary criteria for selecting a baseline year. Off. Noticed Doc.BLYReview_2022_used for TWG_used for order, "Summary" tab.[5] For instance, one year might have been hotter than normal, resulting in greater than average evapotranspiration, but the rainfall might have been higher than normal too, disqualifying the single year. To ensure that all factors were satisfied, the Director combined several years to create an adequate safety factor to ensure senior priority surface water rights were protected.

For example, in the Fourth Methodology Order, the Department's baseline year averaged the SWC diversion volumes for 2006, 2008, and 2012 ("BLY 6/08/12"). *Fifth Methodology Order* ¶ 26, at 11. When averaged, 2006, 2008, and 2012 resulted in a baseline year diversion volume slightly above average (101%). *Fourth Methodology Order* ¶ 27, at 12. The Fourth Methodology Order averaged SWC diversion volumes for three years because no single year met all necessary criteria. *Fourth Methodology Order* ¶ 27, at 12.

For the Fifth Amended Methodology Order, the Director reviewed data from the recent years of 2014–2021. *Fifth Methodology Order* ¶ 26, at 11. Unlike in the Fourth Methodology Order, there were two years, 2018 and 2020, that satisfied all necessary criteria for a baseline year. *Compare Fourth Methodology Order* ¶ 27, at 12 *with Fifth Methodology Order* ¶ 27, at 12; *see also* Off. Noticed Doc. BLY_SWC_TWG_11-16-22, at 12.[6]

After thoroughly reviewing the data, the Director concludes that 2018 best satisfies the criteria for a baseline year. In 2018 the SWC's diversion volume was above average at 104%, ranking fourth in total diversions (from 2000–2021). *Fifth Methodology Order* ¶ 27, at 12; *see also* Off. Noticed Doc. BLYReview_2022_used for TWG_used for order, "Summary" tab.[7] A safety factor of 4% is reasonable. Additionally, 2018 had below average precipitation with above average temperatures and associated growing degree days. Year 2018 therefore satisfies all

[5] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: 2023 5th Amended Methodology Order\BLY\BLYReview_2022_used for TWG_used for order.

[6] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: 2022 Technical Working Group (TWG)\Meeting 11-16-22 Methodology Overview & BLY\BYL_SWC_TWG_11-16-22.

[7] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: 2023 5th Amended Methodology Order\BLY\BLYReview_2022_used for TWG_used for order.

criteria for a baseline year and sufficiently protects senior appropriators. *Fifth Methodology Order* ¶ 27, at 12.

The Ground Water Users propose averaging 2006 and 2018, which produces a diversion volume that is 101%, or just 1% above average, a percentage closer to that used in previous methodology orders. Ex. 837A, at 18; *see also Fourth Methodology Order* ¶ 27, at 12. The purpose of selecting a baseline year with diversions above average is to protect the senior surface water rights, not to select a number closest to the average diversion volume. Historical data illustrates the risk to senior appropriators when the Department selects a BLY with diversion volumes only slightly above average. The data shows that averaging SWC diversion volumes from 2006/2008/2012 for the baseline year resulted in shortfalls in four out of eight years from 2015 to 2022. Ex. 837A, at 82; see also *Fourth Methodology Order* ¶ 27, at 12.

As Judge Wildman previously advised:

> The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the Coalition's rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associated with an average year fail to take into account the legal limitations placed on the Director in responding to a delivery call. . . .
>
> If the Director determined the needs of the Coalition based on historic use data associated with an average year, any decision to administer to less than the full quantity of the Coalition's decreed rights based on that data would not adequately protect its senior rights. Using data associated with an average year by its very definition would result in an under-determination of the needs of the Coalition half of the time. The Director simply cannot rely upon such data if he is going to administer to less than the decreed quantity of the Coalitions' water rights as his analysis would not be supported by clear and convincing evidence.

2014 District Court Order, at 33–34.

The Ground Water Users further contend selecting 2018 as the baseline year was improper "because it falls on the extreme end of the spectrum for precipitation" given that, "from 1992-2021, 2018 was the only irrigation season where there was zero precipitation from July to September." IGWA's Post-Hr'g Br., at 12.

It is true that 2018 was an outlier for lack of precipitation from July–September, and in this regard 2020 would have been a better choice. Off. Noticed Doc. BLY_SWC_TWG_11-16-

22, at 8.[8] The Director did not select 2020 as the baseline year, given the SWC's abnormally high diversion volumes of 110.5% of average. *Id*. at 17.

In sum, after thoroughly reviewing the data, the Director concludes that a safety factor of 4% is reasonable. Year 2018 best satisfies the criteria for a baseline year and sufficiently protects senior appropriators.

2. The R-Squared Value for TFCC's Natural Flow Forecast

The predictive power for accuracy of the TFCC's natural flow multi-linear model can be evaluated by the "R-squared" value on a regression line. Hr'g Tr. vol. III, at 49; Hr'g Tr. vol. I, at 186–87. The R-squared value is a statistical measurement of how closely data points fit on a regression line. Hr'g Tr. vol. I, at 186–87. R-squared values are decimal numbers that range from zero to one. The higher the decimal value, the closer the data are to the regression line, and the greater the percent of variability in the data is explained by the model. Hr'g Tr. vol. I, at 187.

The R-squared value for the TFCC's April predicted natural flow model is 0.72. Ex. 901, at 9. Department employee Matt Anders testified that this R-squared value has declined in recent years, but that the Department is still confident the regression equation is accurately predicting TFCC's natural flow. Hr'g Tr. vol. I, at 224–25.

The ground water users challenge the accuracy of TFCC's natural flow prediction and imply that TFCC's 0.72 R-squared is evidence that the Department's TFCC natural flow forecast is unreliable. Hr'g Tr. vol. I, at 162-65; Hr'g Tr. vol. III, at 49–51, 187–89, 230–33; *see also* Ex. 837A at 23. While not entirely clear, the ground water users appear to believe that the Heise Gage is a poor predictor of TFCC's surface water supply given the number of tributaries that enter the Snake downstream from the Heise Gage. Hr'g Tr. vol. I, at 162-65; Hr'g Tr. vol. III, at 49–51, 187–89, 230–33.

The ground water users also appear to challenge the Department's use of ground-water-derived spring flow from Box Canyon Springs, which the ground water users appear to believe has no correlation with reach gains from the near Blackfoot to Minidoka stretch. Hr'g Tr. vol. I, at 162-65; Hr'g Tr. vol. III, at 49–51, 187–89, 230–33; *see also* Ex. 837A at 23.

The ground water users failed to offer sufficient evidence that TFCC's natural flow forecast is flawed or that TFFC's 0.72 R-squared value is unreasonable. Accordingly, the Director concludes TFFC's 0.72 R-squared value is reasonable and the TFCC's natural flow forecast is sufficiently accurate.

[8] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: 2022 Technical Working Group (TWG)\Meeting 11-16-22 Methodology Overview & BLY\BYL_SWC_TWG_11-16-22.

3. Cumulative Bias

In its April shortfall calculation, the Department employs two bias or safety factors to protect senior water right holders. First, the 2018 BLY diversion volumes must be above average; and second, the forecasted natural flow supply is reduced by one standard deviation. In its July shortfall calculation, the Department employs one bias factor; the diversion volumes for July–October are above average.

The ground water users contend "[t]hese biases compound to aggressively over-predict DS. The *Fifth Methodology Order* takes the overprediction to new heights by adopting a new BLY that is much more aggressive than the BLY used in prior iterations of the Methodology Order." IGWA's Post-Hr'g Br. at 11.

The Director disagrees that the new BLY "aggressively" over-predicts demand shortfall and is "much more aggressive than the BLY used in prior iterations . . . ." As discussed in the baseline year section above, historical data indicates that the Fourth Methodology Order, which averaged diversions for 2006/2008/2012, was not biased enough to protect senior water right holders. In four out of eight years from 2015 to 2022, the April demand shortfall was *less* than the actual demand shortfall in November. Ex. 837A, at 82; see also *Fourth Methodology Order* ¶ 27, at 12. In other words, under the Fourth Methodology Order the safety factors failed to protect seniors 50% of the time.

The 2018 BLY is not anticipated to result in extreme over predictions of the SWC's demand shortfall as alleged by the ground water users. Historical data indicates that if the 2018 BLY had been used from 2015–2022, in one of eight years the April demand shortfall would have been less than the actual demand shortfall in November and in two of eight years, the July demand shortfall would have been less than the actual demand shortfall in November. *Id.*

The Director concludes that the Department's safety factors do not aggressively overpredict demand shortfall.

4. Reduction of TFCC's Decreed Place of Use

CM Rules 42.01.d–e state that, in determining whether a senior irrigator is using water efficiently yet still suffering injury, the Director may consider:

d. [T]he rate of diversion compared to the acreage of land served . . . .

e. The amount of water being diverted and used compared to the water rights.

Collectively, TFCC's natural flow Snake River water rights authorize their shareholders to irrigate 196,162 acres. Ex. 184, at 9, 13, 18; *see also* Hr'g Tr. vol. II, at 81. This 196,162-acre figure represents the number of acres TFCC irrigated in 1987 when the Snake River Basin Adjudication was commenced. Ex. 184, at 2; *see also* Hr'g Tr. vol. II, at 82. It is undisputed TFCC no longer irrigates 196,162 acres, as acreage has been removed from irrigation for various reasons. Hr'g Tr. vol. II, at 82.

TFCC concedes its members are currently irrigating no more than 194,732 acres. Ex. 4, at 1. The 194,732 irrigated acre figure is derived from a 2013 shapefile created by TFCC. *Id*. The Department used the 2013 shapefile to predict TFCC's irrigated acres for 2023. *Fifth Methodology Order* ¶ 22, at 10; *see also 2023 As-Applied Order* ¶ 3, at 1, ¶ 6, at 2; Ex. 337.

Using aerial imagery and Landsat photography from 2017, the Department's GIS staff created what has been commonly referred to as the "2017 irrigated lands dataset" (hereinafter "2017 shapefile"). Hr'g Tr. vol. II, at 68. The 2017 shapefile classified irrigated fields into three categories, irrigated, semi-irrigated, and non-irrigated. *Id.* at 68–69. The shapefile indicated that, in 2017, TFCC members irrigated 180,956 acres. Ex. 4, at 3. The purpose of the 2017 shapefile was to assist Department staff in determining TFCC's irrigation demand in 2017 for use in model calibration. Hr'g Tr. vol. II, at 68, 140–41.

The ground water users argue that, in predicting TFCC's 2023 irrigated acreage, the Director should rely on the Department's 2017 shapefile—not the 2013 shapefile created by TFCC. IGWA's Post-Hr'g Br., at 13–14. The Director disagrees.

The 2017 shapefile is more recent than the 2013 shapefile, but it does not necessarily represent the number of acres TFCC may irrigate in 2023. The 2017 shapefile was a snapshot in time. It does not necessarily predict *future* irrigated acres. In compiling the 2017 shapefile, Department staff did not distinguish "hardened acres" —i.e., fields that have been permanently removed from irrigation—from fields that were not irrigated in 2017 but could be in future years. Hr'g Tr. vol. II, at 194–95.

The same is not true for the 2013 shapefile as explained by its author, a TFCC consultant named David Shaw. Mr. Shaw testified that when he compiled the 2013 shapefile, he specifically excluded hardened acres and included acres that could have been irrigated in 2013 but were not. Hr'g Tr. vol. IV, at 152–53. Unlike the 2013 shapefile, the 2017 shapefile includes only acres that *were irrigated* in 2017 and excludes the acres that *were not irrigated* in 2017 but *could be* irrigated in future years, e.g., 2023. This is a critical distinction because, as Mr. Shaw explains in the SWC's expert report, TFCC "has no way of knowing whether land covered by shares will or will not be irrigated and must prepare to meet the share delivery obligation." Ex. 4 ¶ 7, at 2.

Mr. Shaw also testified that in his opinion the 2013 shapefile currently represents the best available information for determining TFCC's actual irrigated acreage. Hr'g Tr. vol. IV, at 164–65. Finally, the Director has letters from TFCC's counsel stating that from 2014–2022 the number of acres TFCC irrigated has not varied by more than 5% from the previous (2013) shapefile numbers. Ex. 337.

The Ground Water Users also contend that "Jennifer Sukow testified that [the 2017 lands] data set[] represent[s] the best science available to determine actual irrigated acreage . . . ." IGWA's Post-Hr'g Br. at 14. The ground water users are mistaken. During the hearing, Ms. Sukow testified that the 2017 irrigated lands data set was the best data for *model calibration*. Hr'g Tr. vol. I, at 69. Model calibration employs hindcasts, not forecasts. As noted above, the

2017 shapefile was created to assist Department staff in determining historic irrigation demand within the ESPAM boundary during 2017 for use in model calibration. *Id.* at 68, 140–41.

At the hearing and in their post-hearing briefing, the ground water users state that the burden is on TFCC or the Department to create a new shapefile that identifies the number of acres TFCC can irrigate in 2023. The ground water users are mistaken. To reduce TFCC's predicted irrigated acreage below 194,732 acres, the burden is on the junior ground water users to establish the accuracy of a lesser number (e.g., 180,956) by clear and convincing evidence. "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence." *A & B Irr. Dist.*, 153 Idaho at 524, 284 P.3d at 249. The ground water users did not establish an alternative number of acres irrigated by clear and convincing evidence. In short, the ground water users failed to satisfy their burden of proof.

5. Supplemental acres

When determining the total acreage irrigated with surface water by SWC entities, the Department may consider supplemental ground water use. *Fifth Methodology Order* ¶ 23, at 10, ¶ 1, at 40. If acreage is irrigated with ground water instead of surface water, less surface water is needed for irrigation, and any surface water demand shortfall should decrease. In the Fifth Methodology Order, the Department determined that it was without sufficient information to determine the extent of supplemental irrigation on lands within the service areas of the SWC entities. *See Id.* Without sufficient information on supplemental ground water use, the Director is prohibited from reducing a water user's full decreed entitlement. *2014 District Court Order*, at 19 (Holding that the Director was prohibited from administering less than the seniors full decree given that "the record d[id] not contain evidence that acres accounted for . . . [we]re being irrigated from a supplemental ground water source . . . ."). The record in this matter equally lacks sufficient evidence to justify a reduction of the total number of acres irrigated with surface water by SWC members.

IGWA argues that at least some TFCC members have supplemental rights. IGWA's Post-Hr'g Br., at 15. The Department agrees that TFCC's manager and expert Chuck Brockway testified that some TFCC members have supplemental water rights, but he also opined the number is very low. Hr'g Tr. vol. IV, at 52–53.

In his 2014 District Court Order, Judge Wildman noted that:

> [T]he parties fail to cite the Court anything submitted before the Department in either written form or via oral testimony establishing the use of supplemental ground water by individual irrigators within the Coalition.

2014 District Court Order at 19.

The Ground Water Users bear the burden of proving by clear and convincing evidence that SWC acreage was irrigated with supplemental ground water. The Ground Water Users failed to proffer sufficient evidence concerning the quantity of acres TFCC members could

irrigate with supplemental ground water rights. Assertions that IDWR records should identify overlapping ground water rights or that ground water pumping information is best known by the SWC does not change the standard of proof and does not shift the burden of proof borne by the ground water users.

6. The Department's adjustments for "wheeled water"

At times canal companies transport water for third parties through their respective water delivery systems. This transported water, which does not go to meet the canal company member's water supply, is often called "wheeled water." When calculating reasonable in-season demand, it is important to remove wheeled water from SWC diversions. For example, suppose the SWC diverted 3,500,000 acre-feet on a particular year, but 200,000 of those acre-feet was wheeled water. It is necessary to remove the 200,000 acre-feet of wheeled water when calculating SWC's demand, lest it appear SWC members were diverting and using 3,500,000 acre-feet, rather than 3,300,000.

IGWA's expert Sophia Sigstedt advised that her calculations revealed, in determining SWC's 2018 diversion, that IDWR failed to account for approximately 5,000 acre-feet of water wheeled by AFRD2. Ex. 837A, at 20. According to Ms. Sigstedt, IDWR failed to properly subtract all AFRD2's wheeled water in 2018, resulting in a diversion that was 5,000 ac. ft. too high. *Id.* at 16.

On rebuttal, Matt Anders testified that AFRD2's diversion was inaccurately calculated, and the inaccuracy resulted in AFRD2's diversion being 5,000 ac. ft. *too low*. Hr'g Tr. vol. IV, at 173–74. In other words, the miscalculation benefited the Groundwater Users and harmed the SWC, not the other way around.

In sum, there is no evidence that storage water wheeled by the SWC was incorrectly added to the SWC's 2018 surface water demand.

7. 5/8 inch per acre vs. 3/4 inch per acre

At hearing and in its summary brief, IGWA argues that "TFCC shareholders can raise crops on 5/8 inch per acre [headgate delivery] without suffering material injury." IGWA Post Hearing Brief, at 7, 9, 10. However, TFCC's seasonal headgate delivery rate is not the basis for evaluating injury in the current methodology. As IGWA acknowledges, "the Methodology Order does not actually utilize a 3/4-inch headgate delivery, 5/8-inch headgate delivery, or any other headgate delivery as part of its material injury determination for TFCC." *Id.* at 8.

Rather, as IGWA correctly states, the Methodology predicts injury using a baseline year. The baseline year is selected by analyzing climate, available water supply, and current irrigation practices from a single year or average of years. *Fifth Methodology Order* ¶ 8, at 3. The Idaho Supreme Court has affirmed that data from a baseline year can be used to determine reasonable in-season demand and predict material injury. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist*., 155 Idaho at 653, 315 P.3d at 841.

Undaunted, IGWA compares baseline year injury determinations to historical TFCC seasonal headgate delivery rates and concludes, "a hindcast of the Fifth Methodology Order applying it to the time period 2000-2022 shows it generating DS predictions . . ., even though TFCC rarely suffers injury in reality." IGWA's Post-Hr'g Br. at 11–12. IGWA presumably determined there was no "injury in reality" because the Methodology predicted a demand shortfall in years when TFCC received a seasonal or partial season 3/4-inch headgate delivery. IGWA's argument is unpersuasive because, by its own admission, it is relying on a determination of injury that is not a component of this or past methodologies.

C. Efficiency & Waste

CM Rule 42.01.d and g advise that two of the factors the Director may consider in determining whether senior irrigation water right holders are using water efficiently and without waste, while still suffering material injury, are:

> d. [T]he rate of diversion compared to the acreage of land served, the annual volume of water diverted, the system diversion and conveyance efficiency, and the method of irrigation water application[;] [and]
>
> . . . .
>
> g. The extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practice . . . .

In substance, 42.01.d and g authorize the Director to consider whether senior appropriators are wasting water via various unreasonable or inefficient practices.

Project efficiency for each surface water delivery system is unique, depending on numerous factors, including but not limited to: (1) length of delivery system; (2) geological materials through which the system delivers water; (3) nature of structures that deliver water; and (4) method of application of irrigation water. *Fifth Methodology Order* ¶¶ 29–30, at 12–13. In the *Fifth Methodology Order*, the Director calculated recent historical project efficiency (as compared to general "project efficiency") for each SWC member for the 15-year period from 2008 through 2022. *Fifth Methodology Order* ¶ 32, at 14.

The crop water need ("CWN") for each SWC entity for the upcoming season is calculated by averaging each entity's crop mix for the previous three previous years. Off. Noticed Doc. NRT METRIC_SWC_TWG_11-17-22, at 6.[9] Averaging crop mix for the preceding three years is necessary to reflect possible changes in irrigation demands caused by variability in annual crop mix. The SWC's projected reasonable in-season demand ("RISD") for the upcoming season is calculated by dividing each entity's CWN by its recent historical project efficiency.

[9] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: 2022 Technical Working Group (TWG)\Meeting 11-17-22 Forecast Supply & NRT METRIC\NRT METRIC_SWC_TWG_11-17-22.

The Ground Water Users contend the Director's efficiency analysis is inadequate because it fails to adjust for on-the-ground efficiency projects, e.g., canal lining. IGWA's Post-Hr'g Br., at 15. The Ground Water Users argue the Director should require the SWC to satisfy a higher efficiency standard than the recent historical project efficiencies.

The Ground Water Users also criticize the calculation of recent project efficiencies as being circular. Cities' Closing Br., at 7; *see also* IGWA's Post-Hr'g Br., at 15. In effect, the ground water users argue that if the SWC's irrigated acreage number is reduced, but the amount of water delivered doesn't change, the only result will be a reduced efficiency value. IGWA's Post-Hr'g Br., at 15. While the mathematical argument is correct, the purpose of the argument is unclear. It appears the purpose may be to establish that the calculated efficiency numbers are valueless.

To remedy the perceived efficiency calculation errors, the Ground Water Users contend the Department should jettison its historical efficiency analysis and instead judge SWC members efficiencies by comparing them to industry standards. Cities' Closing Br., at 7. The Director disagrees.

The Cities' expert, Greg Sullivan, conceded that the Court has previously rejected the industry standard approach for which the ground water users currently advocate. Hr'g Tr. vol. II, at 201. The Court has already determined that the methodology order's approach to calculating the efficiencies of SWC members is acceptable. *2014 District Court Order*, at 30–31. Mr. Sullivan further admitted that there were no per acre industry standard diversion rates for large open canal systems—as each entity would be different—and that he used the term "industry standard" to mean reasonableness of TFCC's operation compared to its irrigation efficiencies. Hr'g Tr., vol. II, at 225, 237.

Calculating efficiency for large open canal systems is extremely difficult. Hr'g Tr. vol. IV, at 146. TFCC's operation is enormous, with over 1,000 miles of canal, over 4,000 headgates, and over 10,000 concrete structures. Hr'g Tr. vol. II, at 16–18. Evaluating the efficiency of each mile of canal or headgate is a large undertaking. The Ground Water Users, the parties that bear the burden of proof, have not evaluated the SWC's canal and lateral efficiencies.

The Ground Water Users also contend the Director should instruct the Technical Working Group to "develop a mechanism to track real canal efficiency based on real efficiency factors." IGWA's Post-Hr'g Br., at 16. The Ground Water users' proposal attempts to misdirect the burden of proof. "[I]f the junior users believe for some reasons that the seniors will receive water they cannot beneficially use, it is their burden under the established evidentiary standards and burdens of proof to prove that fact by clear and convincing evidence." *2014 District Court Order*, at 31.

TFCC's general manager Jay Barlogi testified that his organization's diversions were reasonable and that TFCC worked hard to improve its efficiency, for example by annually cleaning its canals, lining canals, and replacing over 100 concrete structures per year. Hr'g Tr. vol. II, at 18–20. Mr. Shaw testified that TFCC does a good job maintaining its infrastructure compared to other water delivery organizations, and that TFCC's delivery system is reasonable. Hr'g Tr. vol. IV, at 146.

Lastly, the Ground Water Users imply TFCC is wasting significant quantities of water as evidenced by TFCC's return flows. Hr'g Tr. vol. II, at 191–196. For example, the Cities offered into evidence a document that purports to show TFCC's return flows from 2009–2022. Ex. 365.

Exhibit 365 does not distinguish between natural flow in tributary creeks (e.g., Rock Creek) from water TFCC diverted from the Snake and later returned to the Snake. This matters because measured flows can include irrigation returns as well as water from tributaries. Hr'g Tr. vol. II, at 241. The Cities' exhibit does not prove how much water TFCC diverted from the Snake and later returned.

Return flow data are difficult to obtain. Mr. Anders testified that the Department monitors some of TFCC's return flow, but does not monitor some of the smaller return flows. Hr'g Tr. vol. I, at 128. TFCC's general manager Jay Barlogi testified that he did not believe TFCC was returning a significant amount of water. Hr'g Tr. vol. II, at 43.

The SWC's surface water delivery systems were designed to divert large flow rates delivered to many farmers through long and complex networks of canals and laterals. At the beginning of the irrigation season, these networks must fill over the course of several days. The time needed to fill the canals has a relationship to the time necessary to respond to changes in delivery or emergency. If a large rainstorm reduces the demand for delivery of irrigation water in the canals and laterals, and many users along the delivery system reduce deliveries, the canal company cannot immediately reduce the water being delivered in its system at the diversion from the Snake River. Furthermore, the SWC entity also cannot immediately refill the canals and laterals when the rain stops and the crops demand an immediate water supply. Finally, an emergency on a canal or lateral, like a bank failure, might require that water in the delivery system be discharged from the canals to relieve the system of excess water.

The SWC entities must be able to discharge some water out of its system to ensure delivery of water to its patrons and to operate efficiently within the limits of the delivery system. Testimony at the hearing established that the SWC entities operated efficiently within the limits of their delivery system. *See* Hr'g Tr. vol. II, at 75, 90–91, 94–96; Hr'g Tr. vol. IV, at 146.

The Director concludes TFCC's diversions and efficiency are reasonable.

D. Curtailment

1. Transient vs. Steady-State Modeling

In previous years, the Director used steady-state modeling when determining the curtailment priority date.

In surface water administration, uses by holders of junior priority surface water rights are curtailed until the senior surface water rights are fully satisfied, absent a futile call and if the senior surface water users need the water to accomplish a beneficial use. Under surface water administration, junior surface water rights are generally curtailed unless the senior receives water in the quantity and at the time and place required.

As previously stated in *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 878, 154 P.3d at 449, "[t]he presumption under Idaho law is that the senior is entitled to his decreed water right . . . ." Entitlement to the decreed water right includes receiving water in the quantity and at the time and place required. The Director has a responsibility to respond timely to injury incurred by senior water users; there should be no unnecessary delays in that process. *Id.* "Clearly, a timely response is required when a delivery call is made and water is necessary to respond to that call." *Id.* This is common sense because "[i]n practice, an untimely decision effectively becomes the decision; i.e. 'no decision is the decision.'" Order on Pls.' Mot. for Summ. J., at 97, *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, No. CV-2005-600 (Gooding Cnty. Dist. Ct. Idaho June 2, 2006)

Rule 43 of the CM Rules mandates that when the Director evaluates a mitigation plan, the mitigation plan must ensure that water is delivered to holders of senior priority surface water rights in both the quantity and at the time and place required by the senior. In considering a proposed mitigation plan pursuant to Rule 43.03, the Director must evaluate:

> b. Whether the mitigation plan will provide replacement water, *at the time and place required by the senior-priority water right*, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source *at such time and place as necessary* to satisfy the rights of diversion from the surface or ground water source. Consideration will be given to the history and seasonal availability of water for diversion so as not to require replacement water at times when the surface right historically has not received a full supply, such as during annual low-flow periods and extended drought periods.
>
> c. Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right *when needed during a time of shortage* even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi-season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior-priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.03.11.043.03.b–c (emphasis added). In other words, there is an assumption that senior water right holders calling for delivery of water under the CM Rules will receive, by curtailment or by mitigation, "replacement water, at the time and place required by the senior priority water right, sufficient to offset the depletive effect of ground water withdrawal . . . ." The plan must "assure protection of the senior-priority right in the event the mitigation water source becomes unavailable."

The Director has an obligation to address a mitigation deficiency in the year it occurs. Mem. Decision & Order on Pet. for Jud. Rev., at 10, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-2446 (Twin Falls Cnty. Dist. Ct. Idaho Dec. 3, 2014); Mem. Decision & Order, at 8–9, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-4970 (Twin Falls Cnty. Dist. Ct. Idaho June 1, 2015).

Curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the *full* predicted IDS unless the shortfall exceeds the accruals to the near Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights. This methodology order depends on an annual evaluation of material injury and should also employ curtailment and or mitigation that supplies replacement water at the time and place required by the senior-priority water right in a quantity sufficient to offset the shortfall resulting from ground water withdrawal and to assure protection of the senior-priority right. Curtailment dates, periodically determined at time of recalculating in season demand shortfall (IDS), should be calculated by a transient model simulation that will return the full quantity of water to the senior priority rights at the time and place required, or the maximum quantity that can be returned by curtailing all junior water rights.

The Ground Water Users argue the Director should have determined a priority date for curtailment by steady state modeling of a continuous curtailment that would eventually deliver a volume of water to satisfy the demand shortfall of SWC entities, and require continuous mitigation from holders of ground water rights junior to the calculated priority date. Curtailment would be the threat to ensure the holders of junior ground water rights comply with the mitigation plan. This proposal, while lofty in its equitable ambition, does not follow the legal progression of water administration. In a delivery call proceeding in Idaho, the Director does not impose mitigation plans upon the holders of junior priority water rights. Mitigation plans are proposed by holders of junior priority ground water rights and may be approved by the Director to allow for out-of-priority pumping. Curtailment, or the threat of curtailment, is the tool employed by the Director to force the development of a mitigation plan. Only a threat of continuous curtailment of ground water rights bearing priority dates junior to some unknown priority date would prevent shortfalls to calling parties.

This argument fails because of extreme fluctuations in the Snake River flows caused by fluctuating flows from snowmelt, there are years when there is plentiful surface water for beneficial use and there is no material injury to the calling parties. Water may be flowing past Milner Dam, down the Snake River, and out of the State of Idaho. If there were a curtailment, these facts could be viewed as a waste of water, the antithesis of optimizing the beneficial use of the water of the State of Idaho.

Furthermore, when there is a demand shortfall, the magnitude of the shortfall varies. Choosing a single priority date for continuous curtailment to match one year's shortfall would be inaccurate.

As stated by the CM Rules and by the Courts, out of priority diversion is only allowed by an approved mitigation plan. Junior water right holders can develop or adhere to an approved mitigation plan to avoid curtailment in years of demand shortfalls and allow for out of priority diversions.

2. Futile Call

CM Rule 42.01.c alludes to delayed depletions caused by ground water pumping that affect the "quantity and timing" of water availability to the senior surface water rights. The Director must consider whether "the holders of [senior priority] water rights are suffering material injury" even though the full depletion is not immediate and may be delayed for multiple years:

> Whether the exercise of junior-priority ground water rights individually or collectively affects the quantity and timing of when water is available to . . . a senior-priority surface . . . water right. This may include the seasonal as well as the multi-year and cumulative impacts of all ground water withdrawals from the area having a common ground water supply.

CM Rule 42.01.c.

Delay in the depletive effect of ground water pumping is not grounds for the Ground Water Users to be excused from water administration under the CM Rules. If there is a significant depletion to the senior water rights, even if the impact is spread over multiple years, junior Ground Water Users are subject to water administration.

In support of this conclusion, CM Rule 43.03.c outlines a variety of factors the Director may consider in determining whether a proposed mitigation plan will prevent injury to senior rights including:

> Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right when needed during a time of shortage even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior priority right in the event the mitigation water source becomes unavailable.

If the Director were to determine that curtailment of some ground water rights would not immediately accrue water to the senior priority surface water rights, even though the cumulative impact is significant, and that the delivery call is futile because there is no immediate benefit for the surface water rights, the holders of junior priority ground water rights could recurringly avoid curtailment. Avoiding obligation because of delayed cumulative impact is contrary to the intent of the CM Rules. The Director concludes the delivery call is not futile.

3. Trim line

Establishing a trim line is a close relative to determining a futile call. In the Rangen delivery call, the Director previously established a trim line when the cumulative benefits

of curtailment to a remote spring tributary to the Snake River were de minimus. On appeal, the Idaho Supreme Court stated:

> In light of this challenging balancing requirement, it is necessary that the Director have some discretion to determine in a delivery call proceeding whether there is a point where curtailment is unjustified because vast amounts of land would be curtailed to produce a very small amount of water to the caller. As discussed, Idaho law contemplates a balance between the "bedrock principles" of priority of right and beneficial use. *In Matter of Distribution of Water to Various Water Rights Held By or For Benefit of A & B Irrigation Dist.*, 155 Idaho 640, 650, 315 P.3d 828, 838 (2013). The Director is authorized to undertake this balancing act, subject, as he acknowledged here, to the limitations of Idaho law.

Idaho Ground Water Assoc. v. Idaho Dep't of Water Res., 160 Idaho 119, 132, 369 P.3d 897, 910 (2016).

The spatial distribution of long-term impacts of Ground Water Users on aquifer discharge to the near Blackfoot to Minidoka reach is documented in the record. In Ms. Sigstedt's expert report, Figure 3-6 shows the steady state response function, which is the long-term impact of pumping on the near Blackfoot to Minidoka reach as a percentage of the volume of ground water used. Ex. 837 at 38. Figure 3-6 shows that Ground Water Users on both sides of the Great Rift (the boundary applied to the Rangen delivery call trim line) have significant long-term impacts on aquifer discharge to the nB-Min reach. As a result, the Director concludes that a trimline is not appropriate.

4. Model Uncertainty

Prior to the issuance of the Fifth Methodology Order and 2023 April As-Applied Order, three versions of ESPAM (1.1, 2.1, and 2.2) quantified depletions to surface water supply caused by junior ground water pumping or calculated priority dates for curtailment for this delivery call. These three model versions have also quantified depletions to surface water supply caused by ground water pumping in support of water right administration, including the approval or denial of water right transfer applications. In transfer evaluations, the current and previous versions of ESPAM have calculated the transient impacts of ground water pumping on Snake River reach gains, similar to the transient calculation of curtailment benefit implemented in the Fifth Methodology Order and 2023 April As-Applied Order. Ex. 3, at 7.

The current version, ESPAM version 2.2 was completed in May 2021 and superseded ESPAM version 2.1 as the best available scientific tool for these purposes. Improved representation of ground water and surface water interaction in the near Blackfoot to Neeley reach was identified as one of the priorities for development of ESPAM version 2.2 and significant improvements to the Department's monitoring network and the ESPAM model were implemented with the guidance of the Eastern Snake Hydrologic Modeling Committee to achieve this objective. Off. Noticed Doc. ModelCalibration22_Final, at 1, 3; Off. Noticed Doc.

CurtScen22_FinalwApp, at 10.[10] A predictive uncertainty analysis of ESPAM version 2.2 was performed and presented to the Eastern Snake Hydrologic Modeling Committee in conjunction with the release of the new version. Off. Noticed Doc. E22PredUnc_Final.[11]

While the predictive uncertainty analysis did not specifically quantify the uncertainty of the model predictions applied in the 2023 April As-Applied Order, it does provide a general understanding of the contribution of model calibration to predictive uncertainty for steady-state and transient model scenarios. *Id.* at 41. Model uncertainty is not so significant to suggest that a transient simulation of a single season curtailment will not provide a more accurate estimate of the increase in reach gains expected to occur during the current irrigation season than a steady-state simulation of a continuous curtailment. In other words, there is no evidence that model uncertainty is so significant that a curtailment date calculated using a steady-state simulation, which results in a predicted in-season accrual of approximately 10% of the IDS, could possibly result in an actual in-season accrual approaching 100% of the IDS.

Further, any administrative allowance for uncertainty in the prediction of the volume of water obtained by applying a given curtailment date would be applied to reduce the risk to the senior water user and would result in applying an earlier curtailment date. Because of the safety factor already applied in the calculation of the shortfall, the Director does not find that an additional safety factor needs to be applied to calculation of the priority date. Further, the senior water users did not request that the Director add an additional safety factor to account for ESPAM predictive uncertainty.

E. Due process

The Ground Water Users contend the Department violated their due process rights and the Idaho Administrative Procedures Act by issuing the methodology order before holding a hearing, and by failing to provide the Ground Water Users sufficient time to prepare for the hearing. IGWA's Post-Hr'g Br., at 18. The Ground Water Users are mistaken.

Idaho Code § 42-1701A governs hearings before the Director, and provides among other things that:

> Unless the right to a hearing before the director . . . is otherwise provided by statute, any person aggrieved by any action of the director, including any decision, determination, order or other action, including action upon any . . . approval . . . or similar form of permission required by law to be issued by the director, who is aggrieved by the action of the director, and who has not previously been afforded

[10] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathways: ESPAM Report\ESPAM22_Reports\ ModelCalibrationRpt \ ModelCalibration22_Final; ESPAM Report\ESPAM22_Reports\Scenarios\ CurtScen22_FinalwApp.

an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action.

The Methodology Order constitutes an "order" under § 42-1701A(3), meaning there is no statutory right to a pre-decision hearing concerning an amendment to the Methodology Order. The Idaho Supreme Court has already held that "[t]he Director may develop and implement a pre-season management plan for allocation of water resources that employs a baseline methodology . . . [and is] made available in advance of the applicable irrigation season . . . ." *In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irrigation Dist*., 155 Idaho at 653, 315 P.3d at 841.

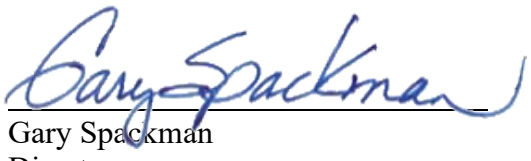
The Idaho Supreme Court has also clearly expressed that the Director has a legal responsibility to *timely* respond to injury incurred by senior water users. Am. Falls Reservoir Dist. No. 2, 143 Idaho at 874, 154 P.3d at 445. The District Court has already ruled in this matter that the process the Department afforded "provides due process consistent with the exigencies of the circumstances and the director's duty to timely administer water rights in priority. And frankly, setting a hearing after the irrigation season as requested is not a tangible alternative . . . ." Excerpt from Hr'g on Admin. Appeals (Court's Ruling) Tr., at 8–9, *City of Pocatello v. Idaho Dep't of Water Res.*, No. CV01-23-08258 (Ada Cnty. Dist. Ct. Idaho June 1, 2023).

In sum, the Ground Water Users' due process rights were not violated, which the District Court has already determined.

ORDER

IT IS HEREBY ORDERED that the Director affirms the Fifth Methodology Order with a few modifications. Because there are some modifications, the Director will simultaneously issue with this order a *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*.

DATED this 19th day of July 2023.



Gary Spackman
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246 or 67-5247, Idaho Code.

Section 67-5246 provides as follows:

(1) If the presiding officer is the agency head, the presiding officer shall issue a final order.

(2) If the presiding officer issued a recommended order, the agency head shall issue a final order following review of that recommended order.

(3) If the presiding officer issued a preliminary order, that order becomes a final order unless it is reviewed as required in section 67-5245, Idaho Code. If the preliminary order is reviewed, the agency head shall issue a final order.

(4) Unless otherwise provided by statute or rule, any party may file a petition for reconsideration of any order issued by the agency head within fourteen (14) days of the service date of that order. The agency head shall issue a written order disposing of the petition. The petition is deemed denied if the agency head does not dispose of it within twenty-one (21) days after the filing of the petition.

(5) Unless a different date is stated in a final order, the order is effective fourteen (14) days after its service date if a party has not filed a petition for reconsideration. If a party has filed a petition for reconsideration with the agency head, the final order becomes effective when:

(a) The petition for reconsideration is disposed of; or
(b) The petition is deemed denied because the agency head did not dispose of the petition within twenty-one (21) days.

(6) A party may not be required to comply with a final order unless the party has been served with or has actual knowledge of the order. If the order is mailed to the last known address of a party, the service is deemed to be sufficient.

(7) A non-party shall not be required to comply with a final order unless the agency has made the order available for public inspection or the nonparty has actual knowledge of the order.

(8) The provisions of this section do not preclude an agency from taking immediate action to protect the public interest in accordance with the provisions of section 67-5247, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: the petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4) Idaho Code.

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days: a) of the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER REVISING APRIL 2023 FORECAST SUPPLY AND AMENDING CURTAILMENT ORDER** **(*METHODOLOGY STEPS 5 & 6*)**

The Director of the Idaho Department of Water Resources ("Department") finds, concludes, and orders as follows:

FINDINGS OF FACT

A. Background

1. On July 19, 2023, the Director issued the *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies Steps 5 and 6 to the 2023 irrigation season.

2. On November 30, 2022, the Director issued the *Final Order Establishing 2022 Reasonable Carryover – Methodology Step 9* ("November Carryover Order") establishing a reasonable carryover shortfall of 49,309 AF. The Director ordered junior ground water users holding consumptive ground water rights within the Eastern Snake Plain Aquifer ("ESPA") area of common ground water supply with priority dates junior to May 31, 1989, to mitigate for their proportionate share of the reasonable carryover shortfall or be curtailed. *November Carryover Order* at 6.

3. On April 21, 2023, the Director issued his *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1 – 3)* ("April Forecast Supply Order"). The April Forecast Supply Order predicted a demand shortfall to the SWC of 75,200 acre-feet for the 2023 irrigation season. *April Forecast Supply Order* at 3. At that time, the only member of the SWC predicted to experience material injury during the 2023 irrigation season was the Twin Falls Canal Company ("TFCC"). The Director ordered that, by May 5, 2023, ground water users with consumptive water rights "junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation plan . . . ." *Id.* at 5. The Director also ordered that, if

a junior ground water user cannot establish they can mitigate for their proportionate share of the predicted demand shortfall in accordance with an approved mitigation plan, "the Director will issue an order curtailing the junior-priority ground water user." *Id.* However, on May 1, 2023, the Director sent notice to affected water users that a hearing on the April Forecast Supply Order would be held June 6–10, 2023, and the Director would wait until after the hearing to decide whether to issue a curtailment order.

4. Step 5 of the Methodology Order addresses the final injury determination to reasonable carryover for members of the SWC. "If the storage allocations held by members of the SWC fill, there is no reasonable carryover shortfall." *Methodology Order* at 43. On July 13, 2023, the Water District 01 published its 2023 Preliminary Storage Report ("Storage Report").[1] The Storage Report stated that TFCC had 1,088 acre-feet of last to fill (i.e., LTF) that did not fill. TFCC has 1,088 acre-feet of LTF space due to its lease of 1,088 acre-feet to the Supplemental Pool in 2020. Because the LTF storage space did not fill due to a lease by TFCC, TFCC's unfilled LTF space is not considered a reasonable carryover shortfall.

5. Step 6 states:

> Approximately halfway through the irrigation season . . . the Director will, for each member of the SWC: (1) recalculate RISD [Reasonable In-Season Demand]; (2) issue a revised FS [Forecast Supply]; and (3) estimate the Time of Need date.

Id. (footnote omitted).

B. April–June Climate

6. The April 2023 Joint Forecast prepared by the United States Army Corps of Engineers and the United States Bureau of Reclamation ("BOR") predicted 3,700,000 acre-feet of natural flow at the Heise gage for the period of April through July 2023. *April Forecast Supply Order* at 2. The Joint Forecast "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." *Methodology Order* at 19 (citation omitted).

7. Spring precipitation (April–June) was variable. According to Natural Resource Conservation Service SNOTEL sites, the Upper Snake received 96%, 64%, and 179% of average precipitation in April, May, and June, respectively. The National Weather Service's Twin Falls weather station reported 20%, 132%, 79% of normal precipitation in April, May, and June, respectively. Temperatures reported by the Twin Falls weather station were -1.6 degrees below normal for April, 4.1 degrees above normal for May, and -0.6 degrees below normal for June.[2]

[1] The *2023 Preliminary Storage Report* can be viewed on-line at the following link: https://www.waterdistrict1.com/media/5piix3cc/2023-prelim-storage-report.pdf .

[2] Precipitation and temperature data obtained from the NOAA National Weather Service Preliminary Monthly Climate Data for the Twin Falls 3SE weather station (Twin Falls Airport).

C. Reasonable In-Season Demand

8. RISD "is the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the projected beneficial use of growing crops within the service area of the entity." *Methodology Order* at 13. In April, the demand from the 2018 BLY defines the RISD. *Id.* at 17. During the irrigation season, the RISD for the completed portion of the irrigation season is recalculated by dividing the actual crop water need ("CWN") for each entity by the project efficiency for that entity. *Id.* at 17, 43. For the remainder of the irrigation season, the RISD is the demand defined by the July–October 2018 BLY. *Id.* RISD is calculated on a monthly time step.

i. Crop Water Need

9. "CWN is the volume of irrigation water required for crop growth within a SWC entity boundary, such that crop growth is not limited by water availability." *Methodology Order* at 15. CWN is the difference between the fully realized consumptive use associated with crop growth, or [evapotranspiration], and effective precipitation . . . ." *Id.*

10. CWN is an input variable for calculating RISD for the completed portion of the irrigation season. *Id.* at 17. Actual RISD for the completed portion of the irrigation season is combined with monthly predicted baseline demands for the remaining months of the irrigation season to calculate a season-total RISD volume. *Id.* at 17-18. In-season demand shortfall is then calculated as the difference between the adjusted FS and the RISD. *Id.* at 23.

11. As calculated from the beginning of the irrigation season (April 1), the SWC's volumetric CWN for the current water year through the month of June is 367,222 acre-feet. This volume is 73% of the April 1–June 30 ten-year average CWN (2013–2022) and 79% of the April 1–June 30 CWN for the 2018 BLY. The following graphs summarize monthly volumetric CWN values:

ii. Extension of BLY

12. The RISD for the remaining portion of the irrigation season (July–October) is the July–October demand for 2018 BLY. The numeric values are shown in the table in Finding of Fact 13 below.

iii. Calculation of RISD

13. As calculated from the beginning of the irrigation season (April 1), the SWC's volumetric RISD for 2023 through the month of June is 991,737 acre-feet. This volume is 72% of the April 1–June 30 ten-year average RISD (2013–2022) and 70% of the April–June demand for the 2018 BLY. The recalculated RISD at this point of the 2023 irrigation season by entity is:

	April–June CWN (AF)	E_p (April - June)	April–June RISD (AF)	July–October Demand for 2018 BLY (AF)	Recalculated RISD (AF)
A&B	8,872	0.46-1.05	15,093	38,528	53,622
AFRD2	41,551	0.22-0.40	129,884	274,485	404,369
BID	31,241	0.31-0.49	78,538	145,546	224,085
Milner	8,578	0.38-0.87	15,353	36,432	51,786
Minidoka	58,753	0.35-0.55	131,152	196,968	328,121
NSCC	86,283	0.23-0.41	278,976	594,099	873,075
TFCC	131,944	0.29-0.51	342,740	653,473	996,214

D. Forecast Supply

14. When determined during the irrigation season, the FS is the sum of the actual natural flow supply from April through June, the predicted natural flow supply from July through

October, and the actual storage allocations. *Methodology Order* at 43. Actual natural flow diversions for the completed portion of the irrigation season are extracted from the Department's water rights accounting program. The natural flow diversions for the remainder of the irrigation season are estimated by regression analysis. *Id.* at 20–21, 43. Storage allocations are determined by Water District 01 after the Day of Allocation. *Id.* at 43.

i. Sum of Actual Natural Flow Diverted

15. Actual natural flow diverted in April through June for each SWC member is shown in the table contained in Finding of Fact 25 below, within the "Summary of Forecast Supply" section.

ii. Regression Models to Predict Natural Flow (July–October)

16. Natural flow diversions were predicted for the remainder of the irrigation season by regression analysis. The Methodology Order established the following variables as predictor variables in the regression models: natural flow in the Snake River near Heise as reported by the BOR, snow water equivalent ("SWE") data at Two Ocean Plateau SNOTEL site, Spring Creek discharge, and groundwater levels near American Falls Reservoir. *Methodology Order* at 20–21. Unique regression models with unique predictor variable groups are established in the Methodology Order for each SWC member.

17. Either June 15 or July 1 SWE values for the Two Ocean Plateau SNOTEL site are used as input variables in each of the regression models developed in the Methodology Order. Two Ocean Plateau SWE data was selected as a predictor variable in the Methodology Order based upon step-wise statistical analysis carried out in the development of each regression model. The Two Ocean Plateau SWE data is an optimum predictor variable for several reasons including: its elevation (the site is located above 9,000 ft and typically still has snow late in the runoff season (June 15 and July 1); its location (the site is in the headwaters of the Snake River above Jackson Reservoir); and its period of record, which is sufficiently long enough to support model development.

18. On July 1, 2023 the Two Ocean Plateau SNOTEL station reported 0.0 inches of SWE. When the snow water equivalent is zero on July 1, the predicted natural flow supplies for the period July 1–October 31 for A&B, AFRD2, and Milner are zero acre-feet. *Methodology Order* at 20.

19. The input variables used to predict the July–October natural flow volumes for BID, Minidoka, and NSCC in 2023 include: (1) 4.1 inches of the SWE reported by the Two Ocean Plateau SNOTEL site on June 15, 2023; (2) 2,935,356 acre-feet of natural flow runoff at the Snake River near Heise (April–June) as reported by the BOR; and (3) 27.61 feet depth to water at well 5S31E27ABA1 as measured by the Department on March 23,2023.

20. The input variables used to predict the July–October natural flow volumes for TFCC in 2023 include: (1) 4.1 inches of the SWE reported by the Two Ocean Plateau SNOTEL site on June 15, (2) 2,935,356 acre-feet of natural flow runoff at the Snake River near Heise

(April–June) as reported by the BOR, and (3) 76,428 acre-feet total discharge at Spring Creek (January–May) as measured and reported by the United States Geologic Survey for its *Spring Creek at Sheepskin Rd Nr Fort Hall ID* Gage (Gage No. 13075983).

iii. Storage Allocations

21. The preliminary storage allocations identified by Water District 01 in the Storage Report for each of the SWC members are reported in the table in Finding of Fact 23 below.

iv. Adjustments to Total Supply

22. The natural flow and storage water supplies were both adjusted as shown in the table in Finding of Fact 23 below. Adjustments to natural flow include wheeled water to Southwest Irrigation District through BID and Milner, 3,714 acre-feet and 3,011 acre-feet, respectively. The only adjustments to the stored water supply in the table below were for the Minidoka Credit. Water supplied to or from the rental pool was not included in the adjustments.

v. Summary of Forecast Supply

23. The following table contains the individual components of the FS for each of the SWC members:

	Natural Flow Diverted 4/1 to 6/30 (AF)	Predicted Natural Flow Diversions 7/1 to 10/31 (AF)	Natural Flow Adjustment (AF)	Preliminary Storage Allocation (AF)	Minidoka Credit Adjustment (AF)	FS (AF)
A&B	15,545	0	0	132,888	0	148,436
AFRD2	148,717	0	0	382,422	1,000	532,147

E. Revised Shortfall Projection

24. In-season demand shortfall ("IDS") is calculated as the difference between RISD and the FS.

25. Based on the above, and as summarized in the table below, the Director predicts no mid-season IDS to the SWC.

	FS (AF)	RISD (AF)	Shortfall (AF)
A&B	148,436	53,622	0
AFRD2	532,147	404,369	0
BID	337,799	224,085	0
Milner	103,362	51,786	0
Minidoka	498,310	328,121	0
NSCC	1,306,091	873,075	0
TFCC	1,076,089	996,214	0
		Total	0

F. Time of Need

26. Step 5 of the Methodology Order requires that the Director estimate the Time of Need if there is water owed to SWC members that is in addition to the reasonable carryover shortfall volume. *Methodology Order* at 43. As stated in Finding of Fact 4, there is no reasonable carryover shortfall. Execution of Step 6 demonstrates there is no mid-season IDS to the SWC for 2023. With no additional water owed to SWC members, there is no need to establish a Time of Need as described in Step 6.

CONCLUSIONS OF LAW

1. Idaho Code § 42-602 authorizes the Director to supervise water distribution within water districts:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

2. Idaho Code § 42-607 states that the watermaster, under the direction of the Director, shall regulate diversions "when in times of scarcity of water it is necessary so to do in order to supply the prior rights of others in such stream or water supply . . . ."

3. Step 5 of the Methodology Order requires that the Director estimate the Time of Need if there is water owed to the SWC members that is in addition to the reasonable carryover shortfall volume. *Methodology Order* at 43. No member of the SWC is owed reasonable

carryover in 2023 for a reasonable carryover shortfall determined in 2022. Execution of Step 6 of the Methodology Order demonstrates there is no mid-season IDS to the SWC for 2023. With no additional water owed to SWC members, there is no need to establish a Time of Need as described in Step 6.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED that there is no mid-season in-season demand shortfall to the SWC members.

Dated this 19th day of July 2023.

GARY SPACKMAN
Director

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 19th day of July 2023, the above and foregoing, was served by the method indicated below, and addressed to the following:

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SIXTH FINAL ORDER REGARDING METHODOLOGY FOR DETERMINING MATERIAL INJURY TO REASONABLE IN-SEASON DEMAND AND REASONABLE CARRYOVER**

BACKGROUND

On April 19, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued his *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order"). The Fourth Methodology Order: (1) explained how the Director would determine material injury to storage and natural flow water rights of members of the Surface Water Coalition ("SWC")[1]; (2) established methods for quantifying material injury to SWC storage and natural flow water rights as predictive and actual demand shortfalls; (3) established methods for quantifying mitigation obligations by holders of junior priority ground water rights for shortfalls in predictive and actual SWC water demands; and (4) established a method for determining a priority date for curtailment if mitigation obligations are not satisfied.

The processes established in the Fourth Methodology Order for determining material injury are not immutable. Updates to the methodology order based on additional data and analyses were always anticipated:

> Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will review and refine the process of predicting and evaluating material injury. The methodology will be adjusted if the data supports a change.

[1] The SWC is comprised of A&B District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company. Each entity holds separate senior surface natural flow water rights and has separate storage contracts for storage water space in the reservoirs.

Fourth Methodology Order, Conclusion of Law 17; *see also In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irrigation Dist.*, 155 Idaho 640, 645, 315 P.3d 828, 833 (2013) ("[t]he concept of a baseline is that it is adjustable . . . ."). The prediction and determination of rights and obligations of the holders of senior priority and junior priority water rights respectively must: (1) apply the best available science and underlying water data; (2) consider changing climatic and cropping patterns; and (3) adhere to the most recent decisions of the courts related to water administration.

Many of the data sets the Department relied upon in the Fourth Methodology Order have been expanded and now include additional years. Furthermore, the Director has had time to review and consider the implications of court decisions that require the Director to address a mitigation deficiency in the year it occurs. As a result, the director issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") on April 21, 2023. The purpose of the Fifth Methodology Order was to update the Director's methodology for determining material injury to storage and natural flow water rights either held by or committed to members of the SWC consistent with the Director's ongoing obligation to use the best available science and information.

On April 21, 2023, the Director also issued his (1) *Final Order Regarding April 2023 Forecast Supply* ("April 2023 As-Applied Order"), as well as a (2) *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing"), which set a hearing on the Fifth Methodology and As-Applied Orders for June 6–10, 2023 ("June 6 Hearing"). During the June 6 Hearing, the parties proffered testimony and evidence regarding the Fifth Methodology Order and the April 2023 As-Applied order.

The purpose of issuing this *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Sixth Methodology Order") is to correct data in the Fifth Methodology Order found to be in error during the June 6 Hearing. This Sixth Methodology Order also edits a few other non-substantive matters in the Fifth Methodology Order.

FINDINGS OF FACT

I. Overview of the Methodology for Determining Material Injury to Water Rights by Determining Reasonable In-Season Demand and Reasonable Carryover

This methodology is based on the selection of a recent analogous, baseline year to predict reasonable in-season demand ("RISD") for the senior priority surface water rights during the upcoming irrigation season.

1. The method for determining material injury to water rights by determining RISD and reasonable carryover should be based on updated data, the best available science, analytical methods, and the Director's professional judgment as manager of the state's water resources. In the future, climate may vary and conditions may change; therefore, the methodology may need to

be adjusted to consider a different baseline year or years ("BLY") or changes to other components.

2. In-season demand shortfall ("IDS") will be computed by subtracting RISD from the forecast supply ("FS"). In-season demand shortfall is computed using the following equation:

$$IDS = FS - RISD$$

3. If the FS is greater than the RISD, there is no demand shortfall. If the FS is less that the RISD, the negative difference is the demand shortfall. Initially, RISD is equal to the historic demands associated with a BLY as selected by the Director, but will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

4. Reasonable carryover shortfall will be computed by subtracting reasonable carryover from actual carryover, where reasonable carryover is defined as the difference between a baseline year demand ("BD") and projected typical dry year supply. Reasonable carryover shortfall will be computed using the following equation:

$$\text{Reasonable Carryover Shortfall} = \text{Actual Carryover} - \text{Reasonable Carryover}$$

5. If actual carryover exceeds the reasonable carryover, there is no reasonable carryover shortfall. In contrast, if reasonable carryover exceeds the actual carryover, the negative difference is the reasonable carryover shortfall.

6. The concepts underlying the selection of the BLY, determination of in-season demand shortfall, and reasonable carryover shortfall will be discussed in detail below.

II. In-Season Demand Shortfall

A. Considerations for the Selection of a Baseline Year

7. A BLY is a year or average of years when irrigation demand represents conditions that can predict need in the current year of irrigation at the start of the irrigation season. The purpose of predicting need is to estimate material injury.

8. A BLY is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) irrigation practices. R. vol. 37, at 7098.[2] To capture current irrigation practices, identification of a BLY is limited to years subsequent to 1999. *Id*. at 7096.

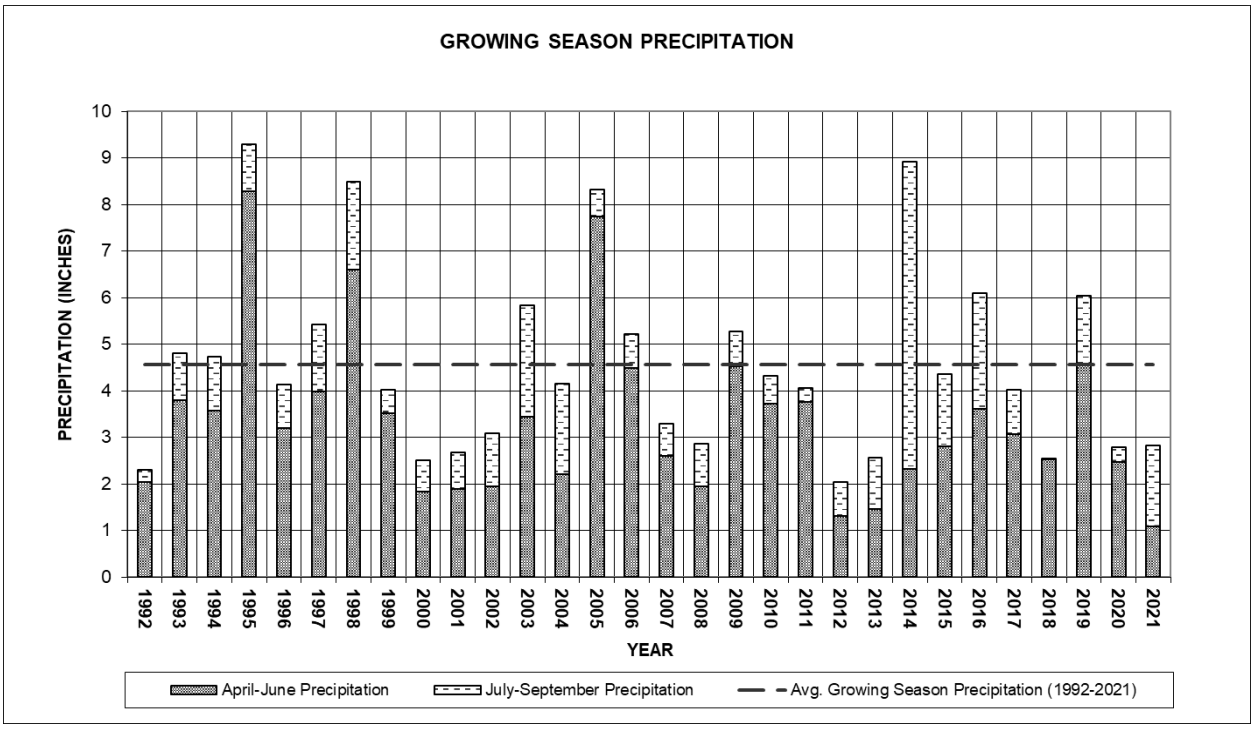
9. The historic diversion volumes from the BLY and the predicted supply forecast at the start of the irrigation season are inputs to predict the initial IDS, where a demand shortfall is the difference after subtracting BD from the FS. When the difference is a positive number, the IDS is zero. When the difference is negative, the negative value equals the in-season demand shortfall. IDS increases with increases in BD, decreases in FS, or both. Assuming constant irrigation practices, crop distributions, and total irrigated acres, demand for irrigation water typically increases in years of higher temperature, higher reference evapotranspiration ("ET"), and lower precipitation. If water demand data is averaged for several years and these averages are the basis to predict demand shortfall at the start of the season, in a high-water demand year, these averages may often under-predict the demand shortfall. In a high-water demand year, under-prediction of IDS might be acceptable if the junior priority ground water right holders and the senior priority surface water right holders shared equally in the risk of water shortages. Equality in sharing the risk will not adequately protect the senior priority surface water right holder from injury. Actual demand shortfalls to a senior surface water right holder resulting from predictions at the start of the irrigation season based on average data unreasonably shifts the risk of shortage to the senior surface water right holder. Therefore, a BLY should represent a year(s) of above average diversions and should not represent a year(s) of average or below average diversions. An above average diversion year(s) selected as the BLY should also represent a year(s) of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors. In addition, actual supply should be analyzed to assure that the BLY is not a year of limited supply.

i. Climate

10. For the methods outlined herein, climate is represented by precipitation, reference ET, and growing degree days.

[2] All citations to "Ex", "Tr.", or "R. vol." in this Order are to material that was admitted during the original January 18–February 5, 2008 Hearing in the Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of [the SWC] ("2008 Hearing") and is part of the final agency record on appeal in Gooding County Case No. CV-2008-551, which was lodged with the Fifth Judicial District Court on February 6, 2009.

11. Precipitation. Water, in all phases, introduced to Idaho from the atmosphere is termed precipitation. During the growing season, precipitation reduces the irrigation water needed for growing crops. Ex. 3024, at 19. The figure below shows the precipitation recorded during the growing season at the National Weather Service's Twin Falls weather station.



Growing Season Precipitation at National Weather Service's Twin Falls Weather Station 1992–2021.[3]

[3] The Fourth Methodology Order included data for the period 1990 through 2014. This Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order. The chart is created from NOAA National Weather Service total precipitation data obtained from the NCDC's Climatological Data Annual Summary Idaho report series for the Twin Falls 6 E and Twin Falls Sun Valley Regional Airport weather stations.

12. Evapotranspiration. ET is a variable representing both the amount of water that transpires from vegetation and the amount of water that evaporates from the underlying soil. ET is an important factor for properly estimating RISD. In its water budget calculations, the SWC proposed the use of ET values from the USBR as part of their Pacific Northwest Cooperative Agricultural Network, i.e., AgriMet. Ex. 8000, vol. II, ch. 9; Ex. 8000, vol. IV, app. AU. The ground water users proposed the use of ET values from Richard G. Allen and Clarence W. Robison 2007, Evapotranspiration and Consumptive Irrigation Water Requirements for Idaho, i.e., ETIdaho. Ex. 3007A, at 21; Ex. 3024, at 1–58.

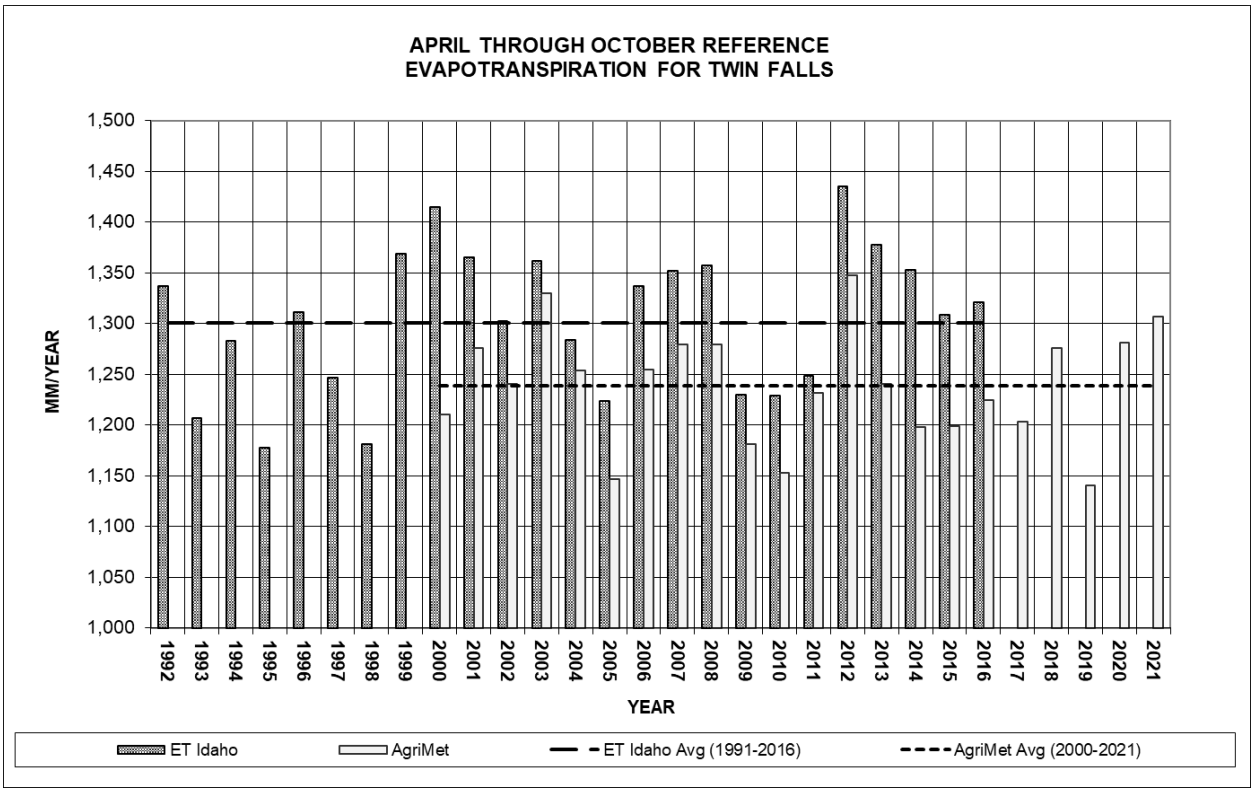
13. Reference ET is a standardized index that approximates the climatic demand for water vapor (i.e., ET). Both ETIdaho and AgriMet calculate and publish reference ET data. The Department will identify potential BLYs by consulting both ETIdaho reference ET and AgriMet reference ET.

14. Neither ETIdaho reference ET data nor AgriMet reference ET data span the entire period of analysis (1992–2021). ETIdaho reference ET data are currently available from 1990 through 2016.[4] AgriMet reference ET data are available from 2000 to 2021.[5] Ideal BLY candidates are years in which reference ET exceeds average reference ET values. Candidate baseline years are compared using both AgriMet and ETIdaho reference ET data for those years in which both data are available and only AgriMet data in those years where there is no ETIdaho data.

[4] The Fourth Methodology Order included ETIdaho reference ET data for the period 1991 to 2011. ETIdaho reference ET data is now available through 2016. The Fifth Methodology Order updated this chart with data for the period 1992 to 2016. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

[5] The Fourth Methodology Order included AgriMet reference ET data for the period 2000 to 2014. AgriMet reference ET data is now available through 2021. The Fifth Methodology Order updated this chart with data for the period 2000 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

15. Years of above average values of reference ET are appropriate BLY candidates.[6] Total April through October reference ET for the period of record from the Twin Falls (Kimberly) AgriMet site is shown below.

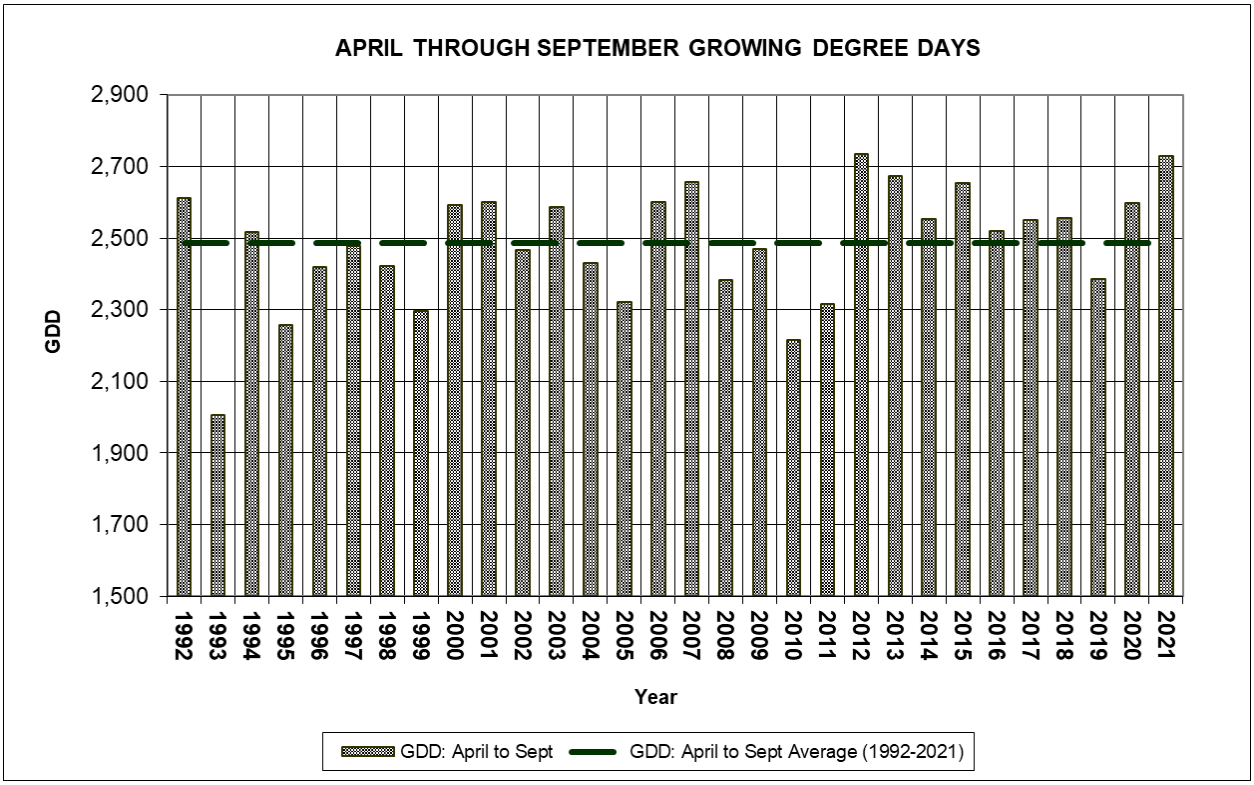


Reference ET for Twin Falls (Kimberly) with both AgriMet and ETIdaho data 1992–2021.[7]

[6] Values for reference ET between ETIdaho and AgriMet do not match because they are derived differently. The relevant information for identifying a potential BLY is the relationship between the year under consideration and the average for the data sets.

[7] The Fourth Methodology Order included data only through 2014. The Fifth Methodology Order updated this chart with combined data for the period 1992 to 2021, establishing a 30-year record which is the professional standard of practice for calculating climatic and hydrologic normals. This Sixth Methodology Order relies on the same data used in the Fifth Methodology Order.

16. Growing Degree Days. Growing degree days define the length and type of growing season. Growing degree days are an arithmetic accumulation of daily mean temperature above a certain base temperature. Ex. 3024, at 10, 117–21. These growth units are a simple method of relating plant growth and development to air temperatures. Different plant species have different base temperatures below which they do not grow. At temperatures above this base, the amount of plant growth is approximately proportional to the amount of heat or temperature accumulated. A higher annual growing degree day value correlates to a higher potential rate of plant growth. The table below shows growing degree days accumulated for April through September for the Twin Falls (Kimberly) AgriMet site.

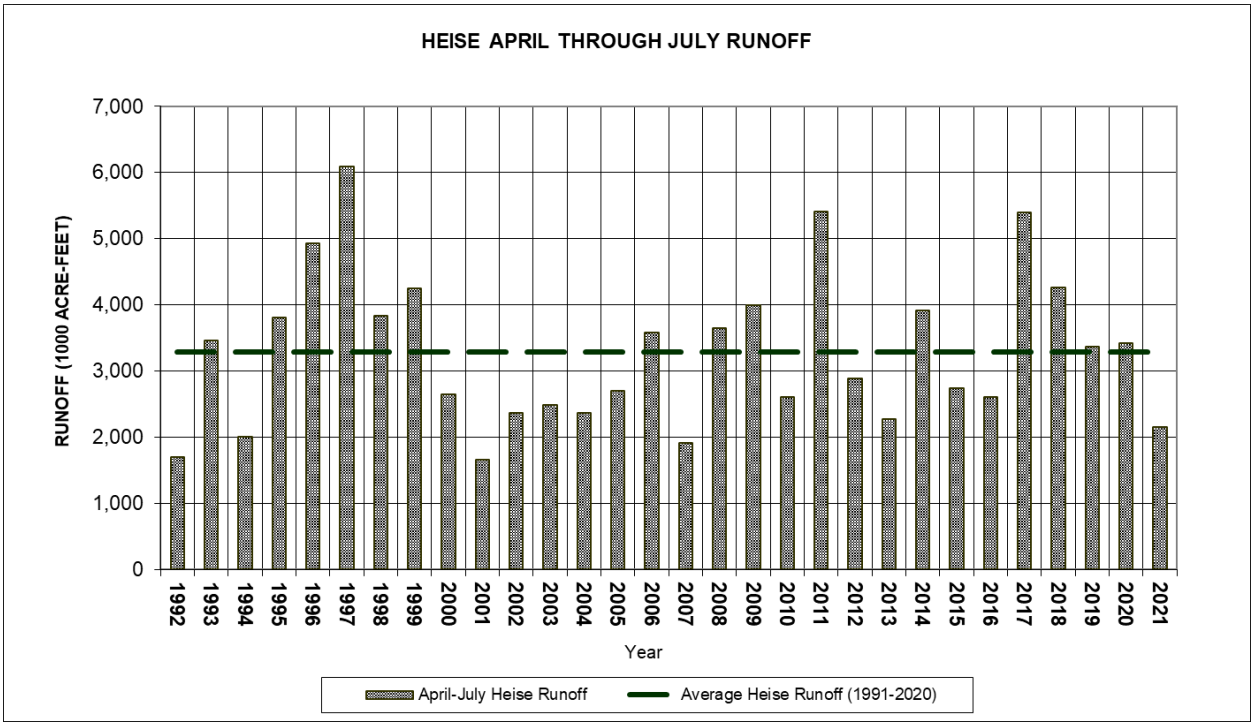


Growing Degree Days ("GDD") for Twin Falls (Kimberly) AgriMet Site 1992–2021.[8]

[8] The Fourth Methodology Order included data only through 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

ii. Available Water Supply

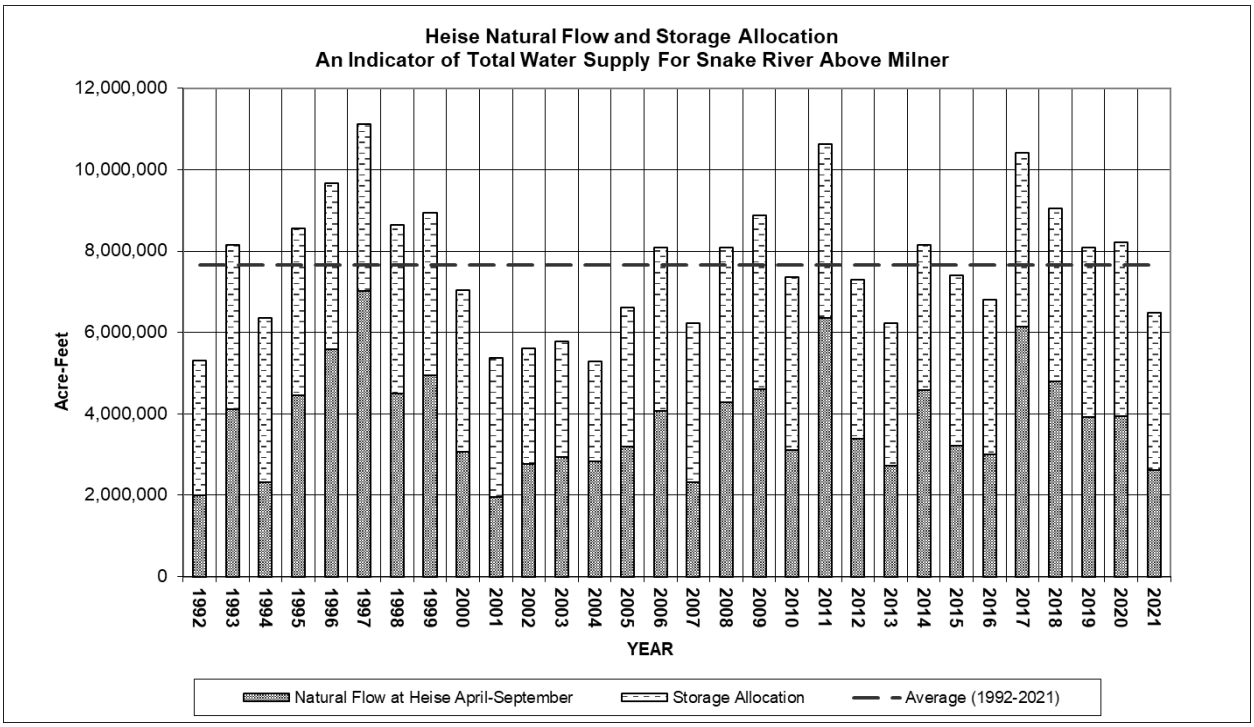
17. The April through July Heise runoff volume represents the volume of water available for diversion into storage reservoirs and is an indicator of natural flow supplies. The graph below shows actual unregulated flow volumes at Heise for 1992 through 2021. The 1992 to 2021 average (3,284,000 acre-feet) is displayed by the dashed line.



April through July Unregulated Flow Volume at Heise, 1992–2021.[9]

[9] The Fourth Methodology Order included data only through 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

18. The sum of the Heise natural flow and the reservoir storage allocations is an indicator of the total supply of the Snake River. The sum of the Heise natural flow and reservoir storage allocations for each year from 1992–2021 is represented in the graph below.



The sum of the Heise natural flow and the storage allocation for the Snake River above Milner 1992–2021.[10]

iii. Irrigation Practices

19. A baseline year ("BLY") must be recent enough to represent current irrigation practices. R. vol. 37, at 7099–7100. Current conditions should be represented by: (a) the net area of the irrigated crops, (b) farm application methods (flood/furrow or sprinkler irrigation), and (c) the conveyance system from the river to the farm. The type of sprinkler systems should be similar between the BLY and the current year.

20. Sprinkler systems are currently the predominant application system. *Id*. at 7101–02. To ensure that current irrigation practices are captured, selection of a BLY for the SWC should be limited to years subsequent to 1999. *Id*. at 7096; 7099–7100.

[10] The Fourth Methodology Order included data for the period 1990 to 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

21. According to the Hearing Officer at the 2008 Hearing, Gerald Schroeder ("Hearing Officer"), beneficial use cannot occur on acres that have been hardened or are otherwise not irrigated. R. vol. 37, at 7100.

22. The following table summarizes: a) SWC entities; b) shapefile source of reported irrigated acres; c) year shapefile created; d) decreed irrigated acres; (e) number of reported acres in shapefile; and f) irrigated acres used in this methodology order for the 2023 irrigation season. The number of irrigated acres used in this methodology order is the number of reported acres unless that number is larger than the decreed irrigated acres, and if so, then the decreed acres were used. This table will be updated annually based on the reported number of irrigated acres by each SWC entity in Step 1 of the Methodology Order.

Entity	Shapefile Source	Shapefile Year	Partial Decree Acres	Shapefile Acres	Acres Used in Methodology
A&B	PPU[1]	2010	15,924	21,972	15,924
AFRD2	PPU	2010	62,361	69,077	62,361
BID	SWC	2013	47,643	46,035	46,035
Milner	PPU	2010	13,335	13,264	13,264
Minidoka	SWC	2023	75,093	77,176	75,093
NSCC	PPU	2010	154,067	224,463	154,067
TFCC	SWC	2013	196,162	194,732	194,732

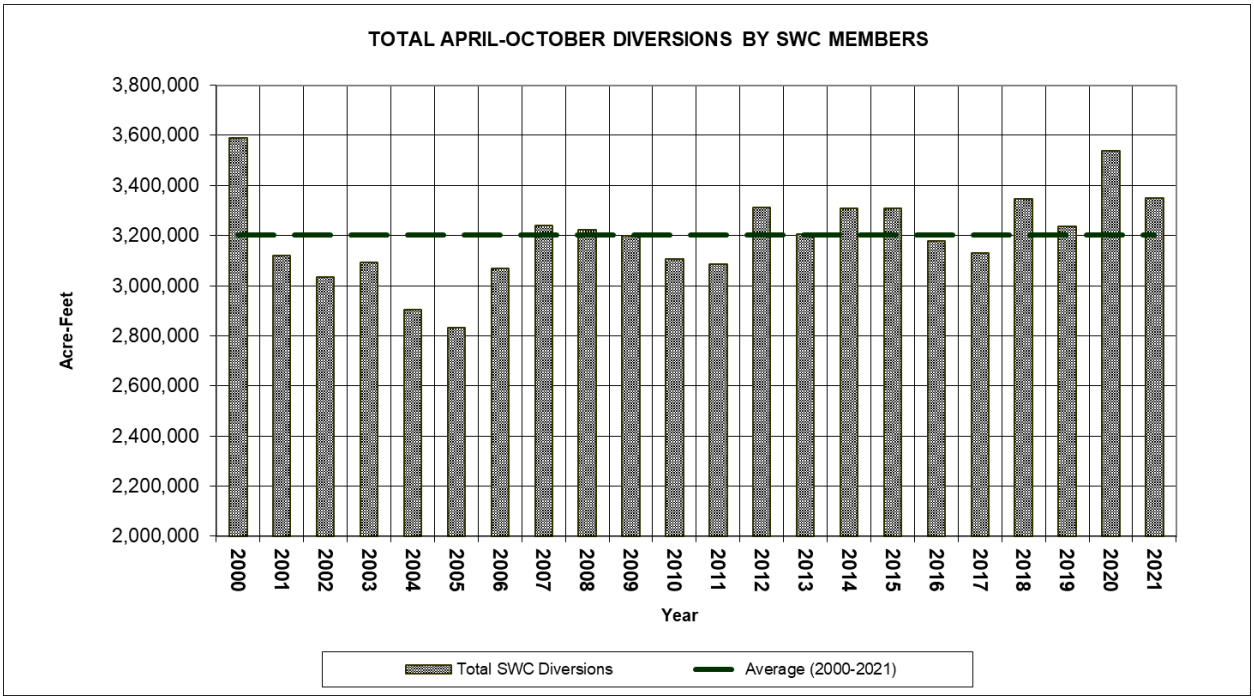
[1] IDWR permissible place of use.

Acres used in the methodology.

23. There are lands within the service areas of SWC entities that are irrigated with supplemental groundwater. Ex. 3007. Supplemental groundwater is a factor the Director can consider in the context of a delivery call. *Memorandum Decision and Order on Petitions for Judicial Review* ("Methodology Remand Order") in Gooding County Consolidated Case No. CV-2010-382, at 18–19. At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities.

iv. Diversions

24. The following figure summarizes the annual measured diversions by the combined SWC members from 2000–2021. Diversions for a baseline year should exceed the average diversions.



Total April–October Diversions by SWC Members.[11]

B. Selection of the Initial Baseline Year

25. When selecting the BLY, the Director must evaluate recent data to determine whether the BLY section criteria are satisfied.

26. In the Fourth Methodology Order, the Department considered the years 2000-2014 when deciding the BLY. Ultimately, the Department chose an average of the years 2006, 2008, and 2012 for the BLY ("BLY 06/08/12"). For this Sixth Methodology Order, the years 2000–2021 were considered for the BLY selection. With the addition of new data from 2014 to 2021, the total diversions by the SWC for the previous BLY 06/08/12 are 100% of the average SWC diversions for the years 2000–2021. As a result of adding the new data, BLY 06/08/12 no longer satisfies the presumption criteria that total diversions in the BLY should exceed the average annual diversions. Mem. Decision & Order on Pets. for Jud. Rev., at 34, *IGWA v. Idaho Dep't of Water Res.*, No. CV-2010-382 (Gooding Cnty. Dist. Ct. Idaho Sept. 26, 2014).

[11] The Fourth Methodology Order did not include this chart. It was added to the Fifth Methodology Order to demonstrate that the baseline year is a year of above average total diversions. As discussed in footnote 12, during the June 2023 Hearing the Department identified an error in AFRD#2's 2018 diversion data. Hr'g Tr. vol. IV, at 173–74. This correction was resolved in this Sixth Methodology Order, which relies on the updated data. The updated data did not result in an appreciable increase in 2018's diversion value.

27. Years 2018 and 2020 satisfy all the BLY selection criteria discussed above. Each of these years had (1) total diversions above the average diversions for the years 2000–2021, (2) total growing degree days above the average for the years 1992–2021, and (3) reference ET values above the average for the years 1992–2021. The years 2018 and 2020 also had total precipitation values below the average precipitation for the years 1992–2021 and were not water supply limited years. The Department has reviewed the SWC's diversion data for the 2020 irrigation season. The Department finds that 2020 ranks as the second-highest year of total diversions for the SWC and is more than one standard deviation above the average for the years 2000–2021. In comparison, 2018 ranks as the fourth-highest year of total diversions for the SWC and is less than one standard deviation above the average for the years 2000–2021. Choosing a BLY with above average diversions but within one standard deviation, ensures that a conservative year is selected that protects the senior while excluding extreme years from consideration. The Director concludes that total diversions for 2018 adequately protect senior water rights when predicting the demand shortfall at the start of the irrigation season and selects 2018 as the BLY.

Entity	2000–2021 Avg. Total Diversions (Acre-Feet)	06/08/12 Avg. Total Diversions (Acre-Feet)	06/08/12 % of Avg.	2018 Total Diversions (Acre-Feet)	2018 % of Avg.
A&B	59,474	59,993	101%	64,192	108%
AFRD2	427,978	427,672	100%	458,890	106%
BID	247,049	251,531	102%	262,211	106%
Milner	53,343	47,135	88%	58,417	110%
Minidoka	354,181	369,492	104%	354,851	100%
NSCC	996,267	978,888	98%	1,026,661	103%
TFCC	1,062,098	1,060,011	100%	1,121,717	106%
Total	3,200,617	3,194,722	100%	3,346,939	105%

Average SWC Diversions (acre-feet) for 2000–2021, 2006/2008/2012 BLY, and 2018 BLY.[12]

C. Calculation of Reasonable In-Season Demand

28. Prior to the irrigation season, reasonable in-season demand ("RISD") is the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the projected beneficial use of growing crops within the service area of the entity. Given that climate and system operations for the year being evaluated will likely be different from the BLY, the RISD must be adjusted for those differences. As stated by the Hearing Officer, "The concept of a baseline is that it is adjustable as weather conditions or practices

[12] In this Sixth Methodology Order, AFRD2's 2018 diversion value has been increased by 5,000 acre-feet. This increase was necessary to remedy the error committed by Department staff in calculating AFRD2's 2018 adjusted diversion value for the Fifth Methodology Order, which was identified during the June 6 Hearing. Hr'g Tr. vol. IV, at 173–74. The error is minor, accounting for approximately 1% of AFRD2's 2018 diversions. The Director concludes that the error had no appreciable impact on any calculations in the Fifth Methodology Order that relied on AFRD2's 2018 diversion volume.

change, and that those adjustments will occur in an orderly, understood protocol." R. vol. 37, at 7098.

i. Project Efficiency

29. Project efficiency ("E_p") is the ratio of total volumetric crop water needs within a SWC entity's boundary and the total volume of water diverted by that entity to satisfy its crop needs. It is the same concept as system efficiency, which was presented at the 2008 Hearing. Ex. 3007, at 28–29. Implicit in this relationship are the components of seepage loss (conveyance loss), on-farm application losses (deep percolation, field runoff), and system operational losses (return flows) for which data is not obtainable by the Department. By utilizing project efficiency and its input parameters of crop water need and total diversions, the influence of the unknown components for which data is not obtainable can be captured and described without quantifying each of the components. Project efficiency is derived by dividing crop water need by total diversions as depicted in the algorithm below:

$$E_p = \frac{CWN}{Q_D}$$

Where:

E_p = project efficiency,
CWN = crop water need, and
Q_D = irrigation entity diversion of water specifically put to beneficial use for the growing of crops within the irrigation entity.

30. Monthly SWC entity diversions ("Q_D") will be obtained from Water District 01's diversion records. Ex. 8000, vol. II, at 8-4, 8-5. Raw monthly diversion values will then be adjusted to remove any water diversions that can be identified to not directly support the beneficial use of crop development within the irrigation entity. Examples of adjustments include the removal of diversions associated with in-season recharge and diversion of irrigation water on the behalf of another irrigation entity. Adjustments are unique to each SWC member and each irrigation season and will be evaluated each year. Any natural flow or storage water deliveries to entities other than the SWC for purposes unrelated to the original right will not be included as a part of the SWC water supply or carryover volume. Water that is purchased or leased by a SWC member may become part of the shortfall obligation to the extent that member has been found to have been materially injured. *See e.g.,* R. vol. 38, at 7201 n.11 (Eighth Supplemental Order). Conversely, water supplied to private leases or to the rental pool by a SWC member will be included as a part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation.

31. Monthly project efficiencies will be computed for the entire irrigation season. Project efficiency varies from month-to-month during the season and will typically be lower during the beginning and ending of the season. Monthly project efficiencies will be divided into actual monthly crop water need ("CWN") values to determine RISD during the year of evaluation.

32. In the Fourth Methodology Order, project efficiencies for each SWC member were initially averaged over an eight-year period (2007–2014) and project efficiency greater or less than two standard deviations were excluded from the calculation. By including only those values within two standard deviations, extreme values from the data set are removed. Under the Fourth Methodology Order, an updated 8-year rolling average of project efficiencies was calculated each year the methodology was implemented. The Director now finds that averaging over a rolling period of 15 years results in project efficiency values that are more consistent from year-to-year, reducing the impact of short-term trends. The Director finds that it is still appropriate to remove project efficiencies greater or less than two standard deviations from the average.

The following is a table of efficiency values averaged over the most recent fifteen-year period of record.

Month	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC	Monthly Avg.
4	0.98	0.33	0.45	0.87	0.43	0.24	0.31	0.51
5	0.47	0.22	0.32	0.39	0.35	0.24	0.30	0.33
6	0.66	0.40	0.49	0.60	0.56	0.41	0.51	0.52
7	0.74	0.44	0.52	0.67	0.63	0.48	0.58	0.58
8	0.58	0.41	0.42	0.55	0.52	0.43	0.46	0.48
9	0.45	0.27	0.32	0.45	0.38	0.32	0.27	0.35
10	0.18	0.16	0.09	0.14	0.11	0.06	0.04	0.11
Season Avg.	0.58	0.32	0.37	0.52	0.43	0.31	0.35	

SWC Member Average Monthly Project Efficiencies from 2007–2021.[13]

ii. Crop Water Need

33. CWN is the volume of irrigation water required for crop growth within a SWC entity boundary, such that crop growth is not limited by water availability. CWN only applies to crops irrigated with surface water. CWN is the difference between the fully realizable consumptive use associated with crop growth, or ET, and effective precipitation (W_e) and is synonymous with the terms irrigation water requirement and precipitation deficit. Ex. 3024. For the purposes of the methodology, CWN is calculated as set forth below:

$$CWN = \sum_{i=1}^{n} (ET_i - W_e) A_i$$

[13] In the Fourth Methodology Order, this table summarized average E_p data for the period 2007 to 2014. The Fifth Methodology Order updated this table with average E_p data for the period 2007 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

Where:

CWN = crop water need
ET_i = consumptive use of specific crop type,
W_e = effective precipitation,
A_i = total irrigated area of specific crop type,
i = index variable representing the different specific crop types grown within the irrigation entity, and
n = upper bound of summation equal to the total number of different specific crop types grown within the irrigation entity.

iii. Evapotranspiration

34. ET can be estimated with theoretically based equations that calculate ET for an individual crop, necessitating crop distribution maps for each year. Ex. 3007A, at 21, fig. 3, tbls. 6–12; Ex. 3024, at 1–58; Ex. 8000, vol. II, ch. 9; Ex. 8000, vol. IV, app. AU.

35. At the 2008 Hearing, values of ET were estimated by the SWC from AgriMet, Ex. 8000, vol. IV, at AU-1, and by the ground water users from ETIdaho, Ex. 3007A, at 21; Ex. 3024, at 1–58. At this time, the Director finds that the use of AgriMet is more appropriate for determining ET than ETIdaho because AgriMet is available to all parties in real-time without the need for advanced programming. Accordingly, the methodology will rely on AgriMet derived ET values in the calculations of project efficiency, CWN, and RISD. In the future, with the development of additional enhancements, ETIdaho may become a more appropriate analytical tool for determining ET.[14]

36. CWN is derived by multiplying crop specific ET values, adjusted for estimated effective precipitation, by the total irrigated area of individual crop types, and summing the CWN for each crop type. The areas for individual crop types will be derived from published crop distributions from the United States Department of Agriculture's National Agricultural Statistics Service ("NASS"). Ex. 1005, at 1. NASS annually creates a crop-specific land cover digital dataset from satellite imagery and field checks. The dataset is called the Cropland Data Layer ("CDL"). Each year, the Department will calculate acreage by crop type for each SWC entity using NASS CDL data. In the future, the NASS data may not be the most accurate source of data. The Department prefers to rely on data from the current season if and when it becomes usable.

37. AgriMet ET and precipitation data are gathered at the Rupert and Twin Falls (Kimberly) stations. Both stations are in the vicinity of the SWC entities. A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), and Minidoka Irrigation District ("Minidoka") are nearest to the Rupert AgriMet station. ET data gathered at the Rupert station reasonably represents the climate conditions for A&B, BID, and Minidoka. American Falls Reservoir District No. 2 ("AFRD2"), Milner Irrigation District ("Milner"), North Side Canal

[14] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed alternative methods of determining ET values, such as METRIC. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet ET data.

Company ("NSCC"), and Twin Falls Canal Company ("TFCC") are nearest to the Twin Falls (Kimberly) AgriMet station. ET data gathered at the Twin Falls (Kimberly) station reasonably represents the climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, vol. IV, at AU-2, AU-8.

iv. Effective Precipitation

38. Effective precipitation ("W_e") is the amount of total precipitation held in the soil horizon available for crop root uptake. Effective precipitation will be estimated from total precipitation (W) employing the methodology presented in the USDA Technical Bulletin 1275. Ex. 8000, vol. IV, at AU-3, AU-8. Total precipitation (W) data is published by the USBR as part of its Pacific Northwest Cooperative Agricultural Network, i.e., AgriMet.[15] Ex. 8000, vol. IV, at AU-3. W_e values derived from AgriMet based precipitation values are independent of crop type.

39. AgriMet precipitation (W) values are easy to understand and regularly used by the farming, water supply, and water management communities. Accordingly, the methodology will rely on AgriMet derived W values in the calculations of CWN and RISD.

40. As with ET data, AgriMet precipitation data are available from the Rupert and Twin Falls (Kimberly) stations. AgriMet data from the Rupert station reasonably represents climate conditions for A&B, BID, and Minidoka. AgriMet data from Twin Falls (Kimberly) reasonably represents climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, vol. IV, at AU-2, AU-8.

v. Summary of Reasonable In-Season Demand Calculation

41. At the start of the irrigation season, RISD is equal to the BD, or total season adjusted diversions for the BLY. When calculated in-season, RISD is calculated below.

$$RISD_{milestonex_x} = \sum_{j=1}^{m}\left(\frac{CWN_j}{E_{p,j}}\right) + \sum_{j=m+1}^{7} BD_j$$

Where:

$RISD_{milestone_x}$ = reasonable in season demand at specified evaluation milestones during the irrigation season,
CWN = crop water need for month j,
E_p = baseline project efficiency for month j,
BD = baseline demand for month j,
j = index variable, and
m = upper bound of summation, equal to the month calculation occurs, where April = 1, May =2, … October = 7.

[15] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meeting, IDWR discussed alternative methods to determine W values, such as PRISM. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet precipitation data.

42. April RISD Adjustment: In April, the calculated RISD, which is the quotient of CWN and Ep, can underestimate actual canal operation diversions. Under-estimation occurs when the actual CWN value for April is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. Often, CWN in April is small due to precipitation, cool temperatures, and/or the immaturity of the crop. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in April, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. To account for the conditions affecting the usability of the calculated RISD value for April, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

43. When the calculation of CWN/Ep results in a value for the month of April less than the average April diversion volume over a record of representative years in the recent past, the April RISD is set equal to the average April diversion volume. When the calculation of CWN/Ep results in a value greater than the average April diversion volume, the April RISD is equal to the calculated CWN/Ep volume.

44. October RISD Adjustment: In October, the calculated RISD, which is equal to the CWN divided by Ep, can both under-estimate and over-estimate actual canal operation diversions. The RISD may be underestimated when the actual CWN value for October is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in October, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. Furthermore, RISD may be underestimated in October when a farmer diverts water at the field head gate for farming practices other than strictly satisfying CWN. Examples of water diversion practices at the field head gate that sometimes occur in October include diverting water for soil salt leaching, diverting water to build up the soil moisture profile for the following irrigation season, and/or diverting water to wet-up bare soil to prevent wind-driven topsoil erosion.

45. Unlike the month of April, RISD can be over-estimated in October. RISD may be over-estimated in years when actual CWN in October is much greater than typical CWN over a record of representative years in the recent past due to low precipitation and/or warm temperatures. To account for the conditions affecting the usability of the RISD value calculated for October, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

46. When the calculation of CWN/Ep results in a value for the month of October greater than the maximum October diversion volume from a record of recent representative years, or less than the minimum October diversion volume from the same record of recent representative years, the October RISD is set equal to the average October diversion volume over

the same period of recent representative years. When the calculation of CWN/Ep results in a value between the maximum and minimum October diversion volumes from a record of recent representative years, the October RISD is equal to the calculated CWN/Ep volume.

D. Adjustment of Forecast Supply

47. As stated by the Hearing Officer, "There must be adjustments as conditions develop if any baseline supply concept is to be used." R. vol. 37, at 7093. A prediction of the upcoming season's supply and demand is calculated at the beginning of the irrigation season and adjusted at specified milestones during the irrigation season to address changes in water supply and demand conditions in response to actual climatic and water supply conditions.

i. April Forecast Supply

48. The FS is comprised of natural flow and stored water.

49. Typically, within the first week of April, the USBR and the USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage from April 1 to July 31 for the forthcoming year. The joint forecast ("Joint Forecast") issued by the United States Bureau of Reclamation ("USBR") and the United States Army Corp of Engineers ("USACE") for the period April 1 through July 31 "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." R. vol. 8, ¶ 98, at 1379. Given current forecasting techniques, the earliest the Director can predict material injury "with reasonable certainty" is soon after the Joint Forecast is issued. R. vol. 2, at 226. With data from 1990 through the irrigation year previous to the current year, a regression equation will be developed for each SWC member.[16] The regression equations for A&B and Milner will be developed by comparing the actual Heise natural flow to the natural flow diverted. *See e.g.,* R. vol. 8, at 1416–22. For AFRD2, BID, Minidoka, NSCC, and TFCC, multi-linear regression equations will be developed by comparing the actual Snake River near Heise natural flow and the flows at Box Canyon to the natural flow diverted. The regression equations will be used to predict the natural flow diverted for the upcoming irrigation season. *Id*. at 1380. The actual natural flow volume predicted in the Director's April FS for each SWC entity will be one standard error below the regression line, which underestimates the available supply. *Id*.; Tr., at. 65:6–25, 66:1–2. The purpose of the shift to one standard error below the regression line is to ensure senior water right holders do not bear the risk of under-prediction of supply. The forecasting techniques will be revised based on updated data and the forecasting techniques may be revised when improvements to the forecasting tools occur.

50. The storage allocation for each member of the SWC will be estimated by the Department following issuance of the Joint Forecast. The Department will forecast reservoir fill and storage allocation consistent with the methods established in the *Fifth Supplemental Order Amending Replacement Water Requirements Final 2006 & Estimated 2007.* R. vol. 23, at 4294–

[16] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed updating the regression models used to forecast the SWC's water supplies in April. However, the Director finds that the current models still adequately forecast water supplies in April and will continue to rely on the existing regression models.

97 as explained below. The Department will evaluate the current reservoir conditions and the current water supply outlook to determine a historical analogous year or years to predict reservoir fill. The Department may identify and use a combination of different analogous years to predict individual reservoir fill. Input variables for determining the individual storage water allocation for each SWC member are: (a) the analogous year's or years' total reservoir fill volume; (b) an estimated evaporation volume; and (c) the previous year's carryover volume. The FS (the combination of the forecast of natural flow supply and the storage allocation) for each SWC member will be determined by the Director shortly after the date of the Joint Forecast.

51. Any time prior to the Director's final determination of the April FS, if the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected shortfall determination.

ii. July Forecast Supply

52. Approximately halfway through the irrigation season, the FS will be adjusted. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the year-to-date natural flow diverted by each member of the SWC. The natural flow diversion for the remainder of the irrigation season will be estimated based on the regression analyses.

53. The natural flow supplies for each SWC member are comprised of natural flow in the Snake River passing the near Blackfoot gage and gains that occur in the Snake River between the Blackfoot to Milner reach. Many different predictor variables were considered when developing the models used to predict the natural flow supplies for the remainder of the season, including those variables used in the April FS.[17] A step-wise statistical analysis was employed to help select the variables for each model. The following variables were selected to forecast water supplies halfway through the irrigation season: natural flow in the Snake River near Heise as reported by the U.S. Bureau of Reclamation; snow water equivalent (SWE) data at the Two Ocean Plateau SNOTEL site; Spring Creek discharge; and groundwater levels near American Falls Reservoir. The model predictors were optimized for each SWC member and are summarized in the sections below.

54. Linear regression equations for AFRD2, A&B, and Milner, will be developed by comparing the July 1 snow water equivalent (inches) at the Two Ocean Plateau SNOTEL site to the natural flow diversions. The regression equations for AFRD2, A&B, and Milner will be applied only in those years when the snow water equivalent at the Two Ocean Plateau SNOTEL site is greater than zero (0). Years when the snow water equivalent equals zero, the total natural flow prediction for the period July 1 to October 31 will be zero (0) AF.

[17] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. IDWR discussed updating the regression models used to forecast the SWC's water supplies in July. However, the Director finds that the current models still adequately forecast water supplies in July and will continue to rely on the existing regression models.

55. Multiple linear regression equations for BID, Minidoka, and NSCC will be developed to predict natural flow diversions employing the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) March depth to water at well 05S 31E 27ABA1 and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

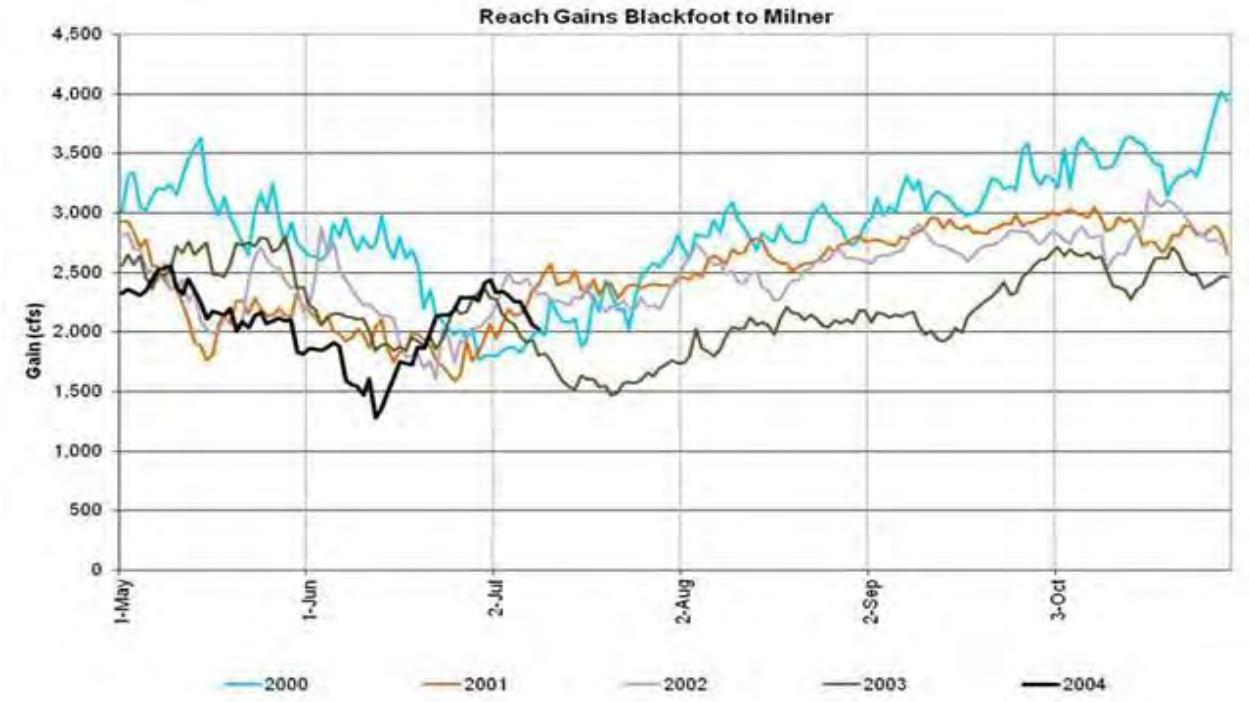
56. The multiple linear regression model for TFCC will be based on the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) Spring Creek total discharge (January – May) and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

57. When adjusting the storage component of the FS, the Department must consider whether stored water has been allocated. In normal to dry years, the reservoirs will typically have filled to their peak capacity for the season and the storage water will have been allocated. If the BOR and Water District 01 have allocated stored water to spaceholders, the Department will use the actual preliminary storage allocations to the SWC. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on the storage allocations from an analogous year or years.

iii. Time of Need

58. The FS will again be adjusted shortly before the Time of Need. The Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

59. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the natural flow diverted by each member of the SWC as of the new forecast date. The natural flow diversion for the remainder of the irrigation season will be estimated based on a historical year with similar reach gains in the Blackfoot to Milner reach. The following is an example of estimating reach gains from an analysis of historical years. Reach gains for the years 2000 – 2003 and a portion of year 2004 are graphed below. Considering 2004 as an example of a current year and comparing 2004 to the hydrographs for 2000 – 2003, year 2003 has similar reach gains and is appropriately conservative. Therefore, the natural flow diverted in 2003 would be used to predict the natural flow diversions for the remainder of the 2004 season.



Example Reach Gain Analysis for 2004.

60. When adjusting the storage component of the FS, the Department will use the actual preliminary storage allocations to the SWC.

61. The adjusted FS is the sum of the year-to-date natural flow diversions, the predicted natural flow diversions for the remainder of the season, and the storage allocation.

E. Calculation of In-Season Demand Shortfall

62. The equation below determines the amount of predicted demand shortfall during the irrigation season.

$$IDS = FS - RISD$$

Where:

IDS = demand shortfall for specified evaluation points throughout the season,
FS = forecasted supply adjusted for specified evaluation point during the season, and
RISD = reasonable in-season demand from above.

63. The amount calculated represents the volume that junior ground water users with approved mitigation plans for delivery of water will be required to have available for delivery to members of the SWC found to be materially injured by the Director to avoid curtailment. The amounts will be calculated in April, at the middle of the season, and at the Time of Need.

III. Methodology for Determining Material Injury to Reasonable Carryover

64. Conjunctive Management ("CM") Rule 42.01.g states the following guidance for determining reasonable carryover: "In determining a reasonable amount of carry-over storage water, the Director shall consider average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system." Carryover shortfall will be determined following the completion of the irrigation season.

A. Projected Water Supply

65. CM Rule 42.01.g states that the Director "shall consider . . . the projected water supply for the system." Because it is not possible to adequately forecast the irrigation supply or demand for the following irrigation season at the end of the current irrigation season, the Director must estimate the carryover water needed in future dry years when demand exceeds supply, creating a need for carryover storage. The Director projected the water supply using typical dry years and subtracted it from a projected future demand to determine a projected carryover need.

66. The Heise natural flow is a predictive indicator of total water supply. For the years 2002 and 2004, the Heise natural flows were well below the long term average (1992–2021), but were not the lowest years on record.[18] The average of the 2002 and 2004 supply will be the projected supply, representing a typical dry year. The 2002 and 2004 supply is computed as follows:

- 2002 supply = natural flow diverted + new storage fill
- 2004 supply = natural flow diverted + new storage fill
- Projected supply = average of 2002 supply and 2004 supply

Carryover from previous years is not included in the 2002 and 2004 new storage fill because it was not new water supplied during the 2002 or 2004 irrigation year.

	2002 Natural Flow Diverted	2002 New Storage Fill	2002 Total Supply	2004 Natural Flow Diverted	2004 New Storage Fill	2004 Total Supply	Projected Supply (Average 02/04)
	----------Acre-Feet----------						
A&B	853	45,603	46,456	1	36,535	36,536	41,496
AFRD2	25,749	381,451	407,200	4,562	309,698	314,260	360,730
BID	89,886	174,454	264,340	102,706	152,387	255,093	259,716
Milner	5,058	43,430	48,488	1,027	35,175	36,202	42,345
Minidoka	143,937	256,602	400,539	141,460	229,574	371,034	385,787
NSCC	363,960	667,799	1,031,759	315,942	479,068	795,010	913,385
TFCC	851,970	186,233	1,038,203	881,345	150,218	1,031,563	1,034,883

SWC water supplies 2002, 2004, and 2002/2004 average (acre-feet).

67. Similar to projecting supply, the Director must also project demand. Because it is not possible to adequately forecast the irrigation demand for the following irrigation season at the end of the current irrigation season, the Director must project demand. R. vol. 37, at 7109. The 2018 BLY will be the projected demand.

[18] The Fourth Methodology Order included data for the period 1991 to 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

68. The maximum projected carryover need is defined as the difference between a BLY demand and projected typical dry year supply. The following equation computes the maximum projected carryover need:

Maximum Projected Carryover Need = Projected Demand (2018 BLY) – Projected Supply (Average 02/04)

	Projected Demand (2018 BLY)	Projected Supply (average 02/04)	Maximum Projected Carryover Need
	----------Acre-Feet----------		
A&B	64,192	41,496	22,696
AFRD2	458,890	360,730	98,160
BID	262,211	259,716	2,495
Milner	58,417	42,345	16,072
Minidoka	354,851	385,787	0
NSCC	1,026,661	913,385	113,277
TFCC	1,121,717	1,034,883	86,834

SWC Projected Demand, Projected Supply and Maximum Projected Carryover Need (acre-feet).[19]

B. Average Annual Rate of Fill

69. CM Rule 42.01.g states that the Director "shall consider the average annual rate of fill of storage reservoirs . . . ." The average annual rate of fill of the storage reservoirs is the average of annual percentages of fill of each entity's reservoir space. The average annual reservoir storage fill is a benchmark that can be compared to projected carryover need. For purposes of the table below, any water contributed to the rental pool from the previous year was added to the next year's fill volume so that it does not artificially lower the percent fill. R. vol. 37, at 7108. Water that is supplied to the rental pool lowers carryover and could impact the following year's fill. The percent fill does not include water deducted for reservoir evaporation.

[19] The Fifth Methodology Order updated this chart with the new baseline year and calculated new maximum projected carryover need values. This Sixth Methodology Order relies on the same data included and calculated in the Fifth Methodology Order with one exception. As described in footnote 12, AFRD2's 2018 diversion value has been increased by 5,000 acre-feet to remedy an error committed by Department staff in calculating AFRD2's 2018 adjusted diversion value for the Fifth Methodology Order. Hr'g Tr. vol. IV, at 173–74.

The annual percent fill of storage volume by SWC entity is shown below:

Year	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
1992	96%	100%	98%	93%	75%	76%	86%

Annual Percent Fill of Storage Volume by Entity (1992–2021).[20]

[20] The Fourth Methodology Order included data from 1995 through 2014. The Fifth Methodology Order updated this chart with data from 1992 through 2021. The Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

C. Average Annual Carryover

70. CM Rule 42.01.g states that the Director "shall consider the . . . average annual carry-over for prior comparable water conditions . . . ." Actual carryover volumes are from annual storage reports published by Water District 1. Actual carryover from 1992 through 2021 are sorted into two categories – below average (dry) and above average (wet). The categories are based on Heise natural flow volumes from April through September.

The 1992 to 2021 average natural flow volume is 3,827 thousand acre-feet ("KAF").

Cat.	Year	Heise Apr–Sept (KAF)	A&B	AFRD2	BID	Milner	MID	NSCC	TFCC
			----------	----------	----------	Acre-Feet	----------	----------	----------
	2001	1,968	9,902	4,217	37,430	26,854	55,132	42,421	26,917
	1992	2,001	11,966	11,548	31,977	28,896	16,928	19,439	3,590

Actual Carryover Volumes by Entity, Sorted by Heise Natural Flow (1992–2021).[21]

[21] In the Fourth Methodology Order, this table summarized data for the period 1994 to 2014 and adjusted WD 01 carryover values to remove water received for mitigation or water rented by the SWC entity to augment their supplies. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021 and used raw carryover values reported by WD 01. Raw numbers were used because adjusted numbers reduced the SWC's

71. In considering the principles articulated in CM Rule 42.01.g, the Director will project reasonable carryover shortfalls for members of the SWC. The following table represents the 2018 BLY diversion volumes and total reservoir storage space by entity. By dividing the total reservoir space by the 2018 diversion volume, a metric is established that describes the total number of seasons the entity's reservoir space can supply water.

	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
	----------Acre-Feet----------						
Projected Demand (2018 BLY)	64,192	458,890	262,211	58,417	354,851	1,026,661	1,121,717
Total Reservoir Space	137,626	393,550	226,487	90,591	366,554	859,898	245,930
Number of Seasons of Reservoir Space	2.1	0.9	0.9	1.6	1.0	0.8	0.2

Total Reservoir Space[22] in Comparison to Demand.[23]

D. Reasonable Carryover

i. A&B

72. A&B's reservoir space has the lowest average annual rate of fill with the highest variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that A&B's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68, 70. A&B has an approximate two-year water supply provided by its total available storage space. *See* Finding of Fact 71. Because of its lower rate of fill, it is likely A&B will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria in CM Rule 42.01.g, A&B's reasonable carryover should be the maximum projected carryover need of 22,700 AF. *See* Finding of Fact 78.

ii. AFRD2

73. AFRD2 has the highest and most consistent reservoir rate of fill of any member of the SWC. AFRD2's storage space fills 99% of the time and has a fill variability of 3%. As

potential entitlement to reasonable carryover. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

[22] *See* R. vol. 8, at 1373–74.

[23] This Fifth Methodology Order updated this chart with a new baseline year and calculated a new number of seasons of reservoir space values. This Sixth Methodology Order relies on the same data included and calculated in the Fifth Methodology Order with the single exception discussed in footnote 12.

shown in the Annual Percent Fill table in Finding of Fact 69 above, its space only failed to fill in 2004 (82%) and 2000 (99%). AFRD2 has a high likelihood of filling during multi-year droughts and after a dry year. *See* Finding of Fact 69. Therefore, any unfilled space in the fall will most likely fill. AFRD2 has an approximate one-year supply available in storage. *See* Finding of Fact 71. AFRD2's storage space only failed to fill in years when the natural flow volume at Heise was less than 3,100 KAF. In a dry year, AFRD2's historical carryover volume is often less than the maximum projected carryover need using the equation set forth in Finding of Fact 68 and 70. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover of 16,700 AF in years when the natural flow volume at Heise was less than 3,100 KAF is the reasonable carryover for AFRD2. *See* Finding of Fact 78.

iii. BID & Minidoka

74. Historically, in dry years, BID's and Minidoka's carryover volumes have been well above the maximum projected carryover need and it is unlikely that they will have reasonable carryover shortfalls in the future. *See* Finding of Fact 68, 70; *see also* R. vol. 37, at 7105. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted downward from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The reasonable carryover for BID and Minidoka is 0 AF. *See* Finding of Fact 78; *see also* R. vol. 37, at 7105.

iv. Milner

75. Similar to A&B, Milner's reservoir space has the second lowest average annual rate of fill of all entities and has a high degree of variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that Milner's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68, 70. Milner has an approximate one and one half water supply available in storage. *See* Finding of Fact 71. Because of its rate of fill, it is likely Milner will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the maximum projected carryover need of 16,100 AF is the reasonable carryover for Milner. *See* Finding of Fact 78.

v. NSCC

76. NSCC has a near-average annual rate of fill in comparison to all entities and an approximate one-year water supply available in storage. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68, 70. Based on the evaluation criteria in CM Rule 42.01.g, the reasonable carryover for NSCC is 113,300 AF. *See* Finding of Fact 78.

vi. TFCC

77. TFCC has a near average annual rate of fill in comparison to all entities, but only 20% of a single year's water supply is available in storage. TFCC's storage space fills 97% of

the time and has a fill variability of 8%. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68, 70. Based on the evaluation of the criteria in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover in dry years of 37,400 AF is the reasonable carryover for TFCC. *See* Finding of Fact 78.

78. Reasonable carryover values for the SWC members are as follows:

	Reasonable Carryover (Acre-Feet)
A&B	22,700
AFRD2	16,700
BID	0
Milner	16,100
Minidoka	0
NSCC	113,300
TFCC	37,400

E. Reasonable Carryover Shortfall

79. Reasonable carryover shortfall is the numerical difference between reasonable carryover and actual carryover, calculated at the conclusion of the irrigation season. Actual carryover is defined as the storage allocation minus the total storage use plus or minus any adjustments. Examples of adjustments include SWC water placed in the rental pool and SWC private leases. Adjustments are unique to each irrigation season and will be evaluated each year. Any storage water deliveries to entities other than the SWC for purposes unrelated to the original right will be adjusted so that the water is not included as a part of the SWC carryover volume. Water that is purchased or leased by an SWC member may become part of the carryover shortfall obligation. *See e.g.,* R. vol. 38, at 7201 n.11 (Eighth Supplemental Order). Conversely, actual carryover must be adjusted to assure that water supplied by a SWC member to private leases or to the rental pool will not increase the reasonable carryover shortfall obligation to the same SWC member.

80. Reasonable carryover shortfall is calculated as follows:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

F. Determination of Curtailment Date

81. The Eastern Snake Plain Aquifer Model ("ESPAM") is the best scientific tool available to simulate aquifer and Snake River responses to stresses applied to the aquifer, such as ground water pumping from a well. Curtailment of junior ground water pumpers in response to the SWC Delivery Call would result in a reduction in the withdrawal of groundwater and a corresponding reduction in aquifer stress. ESPAM simulates the effects of the reduction in

aquifer stress and calculates predicted increases in aquifer discharge to the Snake River resulting from the curtailment of ground water pumping from the ESPA.

82. ESPAM simulations can be either steady-state or transient.

83. Merriam-Webster's Dictionary defines steady-state as "a state or condition of a system or process . . . that does not change in time." *Steady state*, Merriam-Webster.com, https://www.merriam-webster.com/dictionary/steady-state (April 19, 2023). A steady-state ESPAM simulation can only model increases in aquifer discharge to the Snake River resulting from continuous curtailments of an identical magnitude and location until the impacts of curtailment are fully realized. For example, a steady-state analysis of the curtailment of 1,000 acres, assumes that irrigation of the same 1,000 acres is curtailed every year at the same rate of consumptive use, until the impacts of that curtailment reach a steady state, or no longer change from year to year.

84. Steady-state analysis does not calculate the time to reach steady-state conditions nor describe the seasonal timing of the impacts. For the benefits of curtailment predicted by steady-state analysis to be realized by the river, the curtailment must occur continuously until steady-state is achieved. The assumption of continuous curtailment does not reflect reality in the SWC Delivery Call. Curtailments ordered as prescribed in the methodology are neither continuous nor long-term. Irrigation with ground water does not occur at a constant rate throughout the year nor from year to year. It is important to predict what benefits to the river are realized during the irrigation season in which injury has been determined. A steady-state ESPAM simulation cannot predict what benefits are realized during the irrigation season. In contrast, a transient ESPAM simulation will predict the timing of changes in river reach gains.

85. ESPAM was calibrated using one-month stress periods and can simulate a single (or partial) irrigation season of curtailment and predict the resulting increase in aquifer discharge to the Snake River during the same irrigation season using a transient simulation. In the context of this proceeding, the transient approach identifies the junior ground water rights that must be curtailed to produce increases in Snake River flows sufficient to offset material injury in the current irrigation season.

86. Only 9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year.[24] Fifty percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately four years. Ninety percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately 24 years.

87. A curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the full predicted IDS unless the shortfall exceeds the accruals to the near

[24] The near Blackfoot to Minidoka reach is the reach of the Snake River from which the SWC diverts its water supplies.

Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights.

88. Steady-state simulations are appropriate for evaluating the average annual impact of aquifer stresses that have been, or will be, applied for decades (i.e., ground water pumping year after year, or continuous curtailment to the same date every year). The steady-state simulation of continuous curtailment applied in the Fourth Amended Methodology Order does not simulate the short-term curtailments prescribed in the methodology. The methodology prescribes curtailment only in years with a predicted IDS or carryover shortfall and prescribes the determination of a curtailment priority date that varies with the magnitude of the predicted shortfall.

89. Transient simulations are necessary to evaluate the impacts of aquifer stresses applied for short periods of time (i.e., short-term curtailments with varying priority dates). Transient simulations are necessary to simulate the short-term curtailments prescribed in the methodology.

CONCLUSIONS OF LAW

1. This order contains the methodology by which the Director will determine material injury to RISD and reasonable carryover to members of the SWC.

2. "The agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); IDAPA 37.01.01.600.

3. Idaho Code § 42-602 states that, "The director of the department of water resources shall have discretion and control of the distribution of water from all natural sources . . . . The director of the department of water resources shall distribute water . . . in accordance with the prior appropriation doctrine." According to the Hearing Officer, "It is clear that the Legislature did not intend to grant the Director broad powers to do whatever the Director might think right. However, it is clear also that the Legislature [in Idaho Code § 42-602] did not intend to sum up water law in a single sentence of the Director's authority." R. vol. 37, at 7085. "Given the nature of the decisions which must be made in determining how to respond to a delivery call, there must be some exercise of discretion by the Director." *American Falls Res. Dist. No. 2 v. Idaho Dept. Water Resources*, 143 Idaho 862, 875, 154 P.3d 433, 446 (2007).

4. "The prior appropriation doctrine is comprised of two bedrock principles—that the first appropriator in time is the first in right and that water must be placed to a beneficial use." *In Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of A & B Irrigation Dist.*, 155 Idaho 640, 650, 315 P.3d 828, 838 (2012). "The concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*; *American Falls*, 143 Idaho at 879, 154 P.3d at 450 (stating that while an appropriation for a beneficial use is "a valuable right entitled to protection . . . . Nevertheless, that property right is still subject to other requirements of the prior appropriation doctrine."); *Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 131, 369 P.3d 897, 909

(2016) (explaining the "policy of beneficial use" serves as a "limit on the prior appropriation doctrine.").

5. "Concurrent with the right to use water in Idaho 'first in time,' is the obligation to put that water to beneficial use." *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447) (referring to "'the constitutional requirement that priority over water be extended only to those using the water'"). "'It is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation, and the amount of water necessary for the purpose of irrigation of the lands in question and the condition of the land to be irrigated should be taken into account.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar v. Goodrich*, 27 Idaho 26, 44, 147 P. 1073, 1079 (1915)).

6. "[T]he policy of securing the maximum use and benefit, and least wasteful use of Idaho's water resources, has long been the policy in Idaho." *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (citing *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 808, 252 P.3d 71, 89 (2011)). The Idaho Constitution enunciates a policy of promoting "optimum development of water resources in the public interest." Idaho Const. Art. XV, § 7; *Baker v. Ore-Ida Foods, Inc.,* 95 Idaho 575, 584, 513 P.2d 627, 636 (1973). "There is no difference between securing the maximum use and benefit and least wasteful use of this State's water resources and the optimum development of water resources in the public interest. Likewise, there is no material difference between 'full economic development' and the 'optimum development of water resources in the public interest.' They are two sides of the same coin. Full economic development is the result of the optimum development of water resources in the public interest." *Clear Springs*, 150 Idaho at 809, 252 P.3d at 90. "The policy of securing the maximum use and benefit, and least wasteful use, of the State's water resources applies to both surface and ground waters, and it requires that they be managed conjunctively." *Id.*

7. "Conjunctive administration 'requires knowledge by the [Department] of the relative priorities of the ground and surface water rights, how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts the water flows in that source and other sources.' . . . . That is precisely the reason for the CM Rules and the need for analysis and administration by the Director." *American Falls,* 143 Idaho at 877, 154 P.3d at 448.

8. The CM Rules incorporate all principles of the prior appropriation doctrine as established by Idaho law. *American Falls*, 143 Idaho at 873, 154 P.3d at 444; CM Rule 20.02, 10.12.

9. While the presumption under Idaho law is that an appropriator is entitled to his decreed water right and the CM Rules may not be applied to require a senior appropriator to demonstrate an entitlement to the water in the first place, there may be post-adjudication factors relevant to the determination of how much water is actually needed in responding to a delivery call. *American Falls*, 143 Idaho at 877–78, 154 P.3d at 448–49. Under the CM Rules and Idaho law, the Director has the "authority and responsibility to investigate claims when delivery calls

are made," and the "authority to evaluate the issue of beneficial use in the administration context." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840. As the Idaho Supreme Court stated, "'[w]hile the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception . . . the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost.'" *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 433). "[T]he Director must have some discretion to balance these countervailing considerations in a delivery call." *Id*. "'If this Court were to rule the Director lacks the power in a delivery call to evaluate whether the senior is putting the water to beneficial use, we would be ignoring the constitutional requirement that priority over water be extended only to those using the water.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447).

10. In responding to a delivery call under the CM Rules, the Director "may employ a baseline methodology as a starting point for considering material injury," provided the baseline methodology otherwise comports with the prior appropriation doctrine as established by Idaho law. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841; *see Methodology Remand Order* at 17.

11. Once the Director determines "that material injury is occurring or will occur," junior appropriators subject to the delivery call bear "the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call." *American Falls*, 143 Idaho at 878, 154 P.3d at 449; *Methodology Remand Order* at 31. Junior appropriators have the burden of proving by clear and convincing evidence that the delivery call is futile or otherwise unfounded. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841.

12. "This case illustrates the tension between the first in time and beneficial use aspects of the prior appropriation doctrine." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838. The Idaho Supreme Court has in this case "recognized the critical role of the Director in managing the water resources to accommodate both first in time and beneficial use aspects: 'Somewhere between the absolute right to use a decreed water right and an obligation not to waste it and to protect the public's interest in this valuable commodity, lies an area for the exercise of discretion by the Director.'" *Id.* at 651, 315 P.3d at 839 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 451). Thus, in this case the Director may use "a baseline methodology, both as a starting point for consideration of the Coalition's call and in determining the issue of material injury." *Id.* at 650–51, 315 P.3d at 838–39. However, "[i]f changing conditions establish that material injury is greater than originally determined pursuant to the baseline analysis, then adjustments to the mitigation obligation of the juniors must be made when the Director undertakes his mid-season calculations." *Methodology Remand Order* at 18.

13. In the context of conjunctive administration, the Director's methodology for projecting material injury does not impose an obligation upon members of the SWC to reprove

their water rights. To the extent water is available, members of the SWC are authorized to divert and store water in accordance with the terms of their licenses or decrees. Nothing established herein reduces that authorization. The question that the CM Rules require the Director to answer in this proceeding is, when water is not available to fill the water rights of the SWC, how much water is reasonably necessary for the SWC to accomplish the beneficial purpose of raising crops; because what is needed to irrigate crops may be less than the decreed or licensed quantities. *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar*, 27 Idaho at 44, 147 P. at 1079) ("'[i]t is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation"). Again, "[t]he concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*

14. Holders of senior-priority water rights may receive less than their licensed or decreed quantities and not suffer material injury within the meaning of the CM Rules. As a result, in-season demand should be viewed in light of reasonableness and optimum development of water resources in the public interest. CM Rules 20 and 42; *American Falls*, 143 Idaho at 876–80, 154 P.3d at 447–51; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650–52, 315 P.3d at 838–40.

15. Here, the Director has established a methodology for determining material injury to members of the SWC. The methodology predicts material injury to RISD by taking the difference between RISD and the FS. The years 2000 through 2021 were analyzed to select the BLY because the period of years captured current irrigation practices in a dry climate. Based upon evaluation of the record, members of the SWC were exercising more reasonable efficiencies during this time period than during the 1990s when supplies were more plentiful. During periods of drought when junior ground water users are subject to curtailment, members of the SWC should exercise reasonable efficiencies to promote the optimum utilization of the State's water resources. CM Rules 20 and 42; *American Falls,* 143 Idaho at 876–80, 154 P.3d at 447-51; *Clear Springs*, 150 Idaho at 807–10; 252 P.3d at 88–91; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650–52, 315 P.3d at 838–40.

16. At this time, with the recognition that the methodology is subject to adjustment and refinement, RISD will be equal to the historic demands associated with the BLY (2018) and will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

17. Recognizing that climate and surface water supplies (natural flow and storage) are inherently variable, the Director's predictions of material injury to RISD and reasonable carryover are based upon the best available information and the best available science, in conjunction with the Director's professional judgment as the manager of the State's water resources. Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will continue to

review and refine the process of predicting and evaluating material injury. The methodology will continue to be adjusted if the data supports a change.

18. If the Director predicts that the SWC will be materially injured because of a demand shortfall prediction, either in the preseason or in the midseason, the demand shortfall represents a mitigation obligation that must be borne by junior ground water users. If mitigation water in the amount of the projected RISD shortfall cannot be secured or optioned by junior ground water users to the satisfaction of the Director, the Director will curtail junior ground water users to make up any deficit. *See* Order on Pet. for Jud. Rev., at 19, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009),

19. In previous years, the Director used steady-state modeling when determining the curtailment priority date. As part of the Director's ongoing obligation to evaluate the methodology, the Director must evaluate whether the use of steady-state continues to be supportable.

20. In surface water administration, uses by holders of junior priority surface water rights are curtailed until the senior surface water rights are fully satisfied, absent a futile call and if the senior surface water users need the water to accomplish a beneficial use. In other words, under surface water administration, junior surface water rights are generally curtailed unless the senior gets water in the quantity and at the time and place required.

21. Rule 43 of the CM Rules mandates that when the Director evaluates a mitigation plan, the mitigation plan must ensure that water is delivered to holders of senior priority surface water rights in both the quantity and at the time and place required by the senior. In considering a proposed mitigation plan pursuant to Rule 43, the Director must evaluate:

> **b.** Whether the mitigation plan will provide replacement water, *at the time and place required by the senior-priority water right*, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source *at such time and place as necessary* to satisfy the rights of diversion from the surface or ground water source. Consideration will be given to the history and seasonal availability of water for diversion so as not to require replacement water at times when the surface right historically has not received a full supply, such as during annual low-flow periods and extended drought periods.
>
> **c.** Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right *when needed during a time of shortage* even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi-season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior-priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.01.03.11.043.b–c (emphasis added). In other words, there is an assumption that senior water right holders calling for delivery of water under the CM Rules will receive, by curtailment or by mitigation, "replacement water at the time and place required by the senior-priority water right, sufficient to offset the depletive effect of ground water withdrawal . . . ." Only in a mitigation plan can "multi-season accounting of ground water withdrawals" be employed, and even then, the plan must "assure protection of the senior-priority right in the event the mitigation water source becomes unavailable."

22. The Director has an obligation to address a mitigation deficiency in the year it occurs. Mem. Decision & Order on Pet. for Jud. Rev., at 10, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-2446 (Twin Falls Cnty. Dist. Ct. Idaho Dec. 3, 2014); Mem. Decision & Order, at 8–9, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-4970 (Twin Falls Cnty. Dist. Ct. Idaho June 1, 2015).

23. The Director is also obligated to administer consistent with the guidance from the Courts. The Director concludes that any IDS determined by this methodology must be replaced by curtailment in time, place, and quantity unless mitigation allows for out-of-priority diversion of ground water.

24. As described in Finding of Fact 87, curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the *full* predicted IDS unless the shortfall exceeds the accruals to the near Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights. This methodology order depends on an annual evaluation of material injury and should also employ curtailment and or mitigation that supplies replacement water at the time and place required by the senior-priority water right in a quantity sufficient to offset the depletive effect of ground water withdrawal and to assure protection of the senior-priority right. Curtailment dates, periodically determined at time of recalculating in-season demand shortfall (IDS), should be calculated by a transient model simulation that will return the full quantity of water to the senior priority rights at the time and place required.

25. As described in Conclusion of Law 18, junior ground water users with approved mitigation plans to deliver storage water as mitigation must, to the satisfaction of the Director, secure or option mitigation water to avoid curtailment. By requiring that junior ground water users secure mitigation water or have options to acquire water in place during the season of need, the Director ensures that the SWC does not carry the risk of shortage to their supply. By not requiring junior ground water users to deliver or assign mitigation water until the Time of Need, the Director ensures that junior ground water users supply only the amount of mitigation water necessary to satisfy the RISD. All approved methods of mitigation shall be considered in the Director's review of projected RISD shortfall.

26. Unless there is reasonable certainty that junior ground water users can secure the predicted volume of water and provide that water at the Time of Need, the protection afforded to the senior water right holders is compromised. The risk of shortage is then impermissibly shouldered by the SWC. Members of the SWC should have certainty entering the irrigation

season and at midseason that mitigation water will be delivered or assigned at the Time of Need, or curtailment of junior ground water rights will be ordered.

27. Because climate and the supply that the SWC appropriated (natural flow and storage) are inherently variable, the Director cannot and should not insulate the SWC against all shortages. The Director can, however, protect the SWC against reasonably predicted shortages to RISD.

28. Currently, the USBR and USACE's Joint Forecast is an indispensable predictive tool at the Director's disposal for predicting material injury to RISD. Given current forecasting techniques, the earliest the Director can predict material injury to RISD with reasonable certainty is soon after the Joint Forecast is issued in early April. The pre-irrigation season supply forecast for A&B and Milner can be predicted solely from the Joint Forecast. To improve the accuracy of prediction, the pre-irrigation season supply forecast for AFRD2, BID, Minidoka, NSCC, and TFCC will currently be predicted from both the Joint Forecast and from flow data at Box Canyon.[25]

29. By shifting the April Forecast Supply prediction curve down one standard error of estimate, the Director purposely underestimates the water supply that is predicted. The Director further guards against RISD shortage by using the 2018 BLY, which has above average diversions, above average ET, below average in-season precipitation, and above average growing degree days. The 2018 BLY represents a year in which water supply did not limit diversions. The Director's prediction of material injury to RISD is purposely conservative. While it may ultimately be determined after final accounting that less mitigation water was owed than was provided, this is an appropriate burden for junior appropriators to carry. Idaho Cost. Art. XV, § 3; Idaho Code § 42-106. Shifting the prediction curve down one standard error of estimate and adoption of a BLY that uses above average diversions, above average temperatures and ET and below average precipitation is necessary to protect senior rights if the Director administers to an amount less than the full decreed quantity of the SWC's rights. *Methodology Remand Order* at 33, 35.

30. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water provided by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

31. "Storage water is water held in a reservoir and is intended to assist the holder of the water right in meeting their decreed needs." *American Falls*, 143 Idaho at 878, 154 P.3d at 449. "Carryover is the unused water in a reservoir at the end of the irrigation year which is retained or stored for future use in years of drought or low-water." *Id.* Under Idaho Code, "[o]ne may acquire storage water rights and receive a vested priority date and quantity, just as with any other water right," but "[t]here is no statutory provision for obtaining a decreed right to 'carryover' water." *Id.* Rather, carryover is a "component of the storage right." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-

[25] The method for predicting the natural flow supply may be subject change based upon improved predictive models.

0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009). Storage carryover is "permissible . . . absent abuse." *American Falls*, 143 Idaho at 880, 154 P.3d at 451.

32. The storage reservoirs implicated in this proceeding were intended to provide supplemental supplies of water "to create a buffer against the uncertainty of the weather." *Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation* (April 29, 2008) at 6. "The history of the development of the reservoir system, most recently Palisades, makes it clear that storage of water was a primary purpose to prevent disaster during periods of shortage as have been experienced in the recent past." *Id*. at 60. The purpose of carryover also is "insurance against the risk of future shortage." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009).

33. CM Rule 42.01 sets forth factors the Director "may consider in determining whether the holders of water rights are suffering material injury and using water efficiently and without waste." CM Rule 42.01 does not limit the Director's determination of reasonable carryover to consideration of the factors enumerated in CM Rule 42.01g, but only requires that the Director consider those enumerated factors. One such factor is "[t]he extent to which the requirements of the holder of a senior priority water right could be met with the user's existing facilities and water supplies." CM Rule 42.01g. This factor is qualified, however, by the provision that "the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years." CM Rule 42.01g. Thus, CM Rule 42.01g does not require water right holders to exhaust their storage water supplies prior to making a delivery call under the CM Rules. This is consistent with the purposes of the storage reservoirs and the carryover components of the storage water rights.

34. In considering CM Rule 42.01g in *American Falls*, the Idaho Supreme Court framed the SWC's challenge to the "reasonable carryover" provision as presenting the question of whether the holders of storage water rights are "entitled to insist on all available water to carryover for future years in order to assure that their full storage water is met (regardless of need)," *American Falls,* 143 Idaho at 879, 154 P.3d at 450, and answered this question in the negative:

> At oral argument, one of the irrigation district attorneys candidly admitted that their position was that they should be permitted to fill their entire storage water right, regardless of whether there was any indication that it was necessary to fulfill current or future needs and even though the irrigation districts routinely sell or lease the water for uses unrelated to the original rights. This is simply not the law of Idaho. While the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception. As previously discussed, the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost. Supra, paragraph 11.

Id. at 880, 154 P.3d at 451.

35. As discussed in the Findings of Fact, reasonable carryover is determined by projecting the water supply for the system. This is accomplished by projecting the 2002/2004 natural flow and average annual storage fill and the 2018 demand. Next, the Director examines the average annual rate of fill of each SWC entity's reservoir space to determine each entity's relative probability of fill. Finally, the Director examines the average annual carryover for prior comparable water conditions by reviewing Heise natural flow.

36. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of the SWC. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights.

37. Recognizing that reservoir space held by members of the SWC may fill, and to prevent the waste of water, junior ground water users are not required to deliver or assign the volume of reasonable carryover until after the Day of Allocation (defined in footnote 11, *infra*). Junior ground water users are obligated to hold the secured or optioned mitigation water until reservoir space held by the SWC fills. If the reservoir space does not fill, junior ground water right holders must deliver or assign the secured or optioned mitigation water to the senior water right holders up to the amount of storage space that did not fill.

ORDER

Consistent with the forgoing, the Director HEREBY ORDERS that, for purposes of determining material injury to RISD and reasonable carryover, the following steps will be taken:

1. Step 1: By April 1, members of the SWC will submit electronic shape files to the Department delineating the total anticipated irrigated acres for the upcoming year within their water delivery boundary or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent. Department staff will review submitted shapefiles and modify them as necessary to ensure that: (1) the total acreage count does not exceed the decreed number of acres; (2) all of the irrigated land is located within the decreed place of use; and (3) acres are not counted more than once due to overlapping polygons within a shape file or between shape files submitted by different SWC members. Because the SWC members can best determine the irrigated acres within their service area, the SWC should be responsible for submitting the information to the Department. If this information is not timely submitted, the Department will determine the total irrigated acres based upon past cropping patterns and current satellite and/or aerial imagery. If a SWC member fails or refuses to identify the number of irrigated acres within its service area by April 1, the Department will be cautious about recognizing acres as being irrigated if there is uncertainty about whether the acres are or will be irrigated during the upcoming irrigation season. The Department will electronically post

electronic shape files for each member of the SWC for the current water year for review by the parties. In determining the total irrigated acreage, the Department may account for supplemental ground water use. The Department currently does not have sufficient information to accurately determine the contribution of supplemental ground water to lands irrigated with surface water by the SWC. If and when reliable data is available to the Department, the methodology will be amended to account for the supplemental ground water use.

2. If the acreage count is under reported by more than five percent of the irrigated acreage limit of the water right, then the Department will assess the impact of this reduction in use of the water right on any mitigation requirement.

3. Step 2: Typically within the first two weeks of April, the USBR and USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage for the period April 1 through July 31. Within fourteen (14) days after issuance of the Joint Forecast, the Director will issue a final order predicting the April FS for the water year for each SWC entity. The Director will compare the April FS for each SWC entity to the BD for each SWC entity to determine if an in-season demand shortfall ("IDS") is anticipated for the upcoming irrigation season. The April FS for each SWC entity is the sum of the forecasted natural flow supply and the forecasted storage allocation for each SWC entity. The forecasted natural flow supply will be computed with regression algorithms. The forecasted storage allocation will be determined by comparing storage accruals in an analogous year(s). A transient ESPAM simulation will be run to calculate the curtailment priority date predicted to produce a volume of water equal to the IDS in the near Blackfoot to Minidoka reach between May 1 and September 30 of the current year. Curtailment will be simulated within the area of common ground water supply as described by CM Rule 50.01.

4. Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April IDS unless the April IDS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

5. Step 4: As soon as practical after the deadline for junior ground water users with approved mitigation plans to provide notice of secured water, the Director will issue an order curtailing junior ground water users who: (1) do not have approved mitigation plans; (2) fail to secure the required water consistent with their approved mitigation plans; or (3) otherwise fail to comply with their approved mitigation plans.[26]

[26] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

6. If, at any time prior to the Director's final determination of the April FS, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected demand shortfall determination.

7. Step 5: If the storage allocations held by members of the SWC fill, there is no reasonable carryover shortfall. If the storage allocations held by members of the SWC do not fill, within fourteen (14) days following the publication of Water District 01's initial storage report, which typically occurs soon after the Day of Allocation,[27] the volume of water secured by junior ground water users to fulfill the reasonable carryover shortfall shall be made available to injured members of the SWC. The amount of reasonable carryover to be provided shall not exceed the empty storage space on the Day of Allocation for that entity. If water is owed in addition to the reasonable carryover shortfall volume, this water shall be delivered or assigned to members of the SWC at the Time of Need, described below. The Time of Need will be no earlier than the Day of Allocation.

8. Step 6: Approximately halfway through the irrigation season, but following the events described in Step 5, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS; and (3) estimate the Time of Need date.[28]

9. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The cumulative CWN volume will be calculated for all land irrigated with surface water within the boundaries of each member of the SWC. Volumetric values of CWN will be calculated using ET and precipitation values from the USBR's AgriMet program, irrigated areas provided by each entity, and crop distributions based on NASS data.

10. The FS for each SWC is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on regression analysis. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on an analogous year(s).

11. The calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

---

[27] The Day of Allocation is the time in the irrigation season when the Water District 01 watermaster can issue allocations to storage space holders after the reservoir system has achieved its maximum physical fill, maximum water right accrual, and any excess spill past Milner Dam has ceased. Tr., at 902:7–25, 903:1–10.

[28] At the earliest established Time of Need for any member of the SWC, junior ground water users are required to provide remaining mitigation to all materially injured members of the SWC.

12. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. The Director will then issue revised RISD and DS values. Any increase to the projected IDS for each SWC entity is an additional mitigation obligation of the junior ground water users.

13. Upon a determination of an additional mitigation obligation, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to secure a volume of storage water or to conduct other approved activities pursuant to an approved mitigation plan that will deliver the additional mitigation obligation water to the injured members of the SWC at the Time of Need. If junior ground water users fail or refuse to submit this information within fourteen (14) days from issuance of a Step 6 order, the Director will issue an order curtailing junior ground water users.[29] A transient ESPAM simulation will be run to determine the priority date to produce the necessary additional mitigation obligation volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

14. Step 7: Shortly before the estimated Time of Need, but following the events described in Steps 5 and 6, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS; and (3) establish the Time of Need. The revised FS for each SWC entity is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on analogous year(s) with similar Blackfoot to Milner reach gains. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01.

15. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The Director will then issue revised RISD and IDS values.

16. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the demand shortfall volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

17. Step 8: At the Time of Need, junior ground water users are required to deliver to each injured member of the SWC the Step 7 revised IDS calculated at the Time of Need. Alternatively, any additional mitigation obligation calculated in Step 6 and Step 7 can be satisfied from each SWC member's reasonable carryover if (a) the reasonable carryover exceeds the additional mitigation obligation, and (b) the junior ground water users secure sufficient water to replace the reasonable carryover pursuant to an approved mitigation plan.

[29] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

18. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water delivered by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

19. Step 9: Following the end of the irrigation season (on or before November 30), the Department will determine the total actual volumetric demand and total actual CWN for the entire irrigation season. This information will be used for the analysis of reasonable carryover shortfall, selection of future BLY, and for the refinement and continuing improvement of the method for future use.

20. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of SWC. These estimates will be based on, but not limited to, the consideration of the best available water diversion and storage data from Water District 01, return flow monitoring, comparative years, and RISD. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the reasonable carryover shortfall volume by September 30 of the following year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

IT IS FURTHER ORDERED that this Sixth Methodology Order supersedes all previously issued methodology orders in this matter.

Dated this 19th day of July 2023.

GARY SPACKMAN
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246 or 67-5247, Idaho Code.

Section 67-5246 provides as follows:

(1) If the presiding officer is the agency head, the presiding officer shall issue a final order.

(2) If the presiding officer issued a recommended order, the agency head shall issue a final order following review of that recommended order.

(3) If the presiding officer issued a preliminary order, that order becomes a final order unless it is reviewed as required in section 67-5245, Idaho Code. If the preliminary order is reviewed, the agency head shall issue a final order.

(4) Unless otherwise provided by statute or rule, any party may file a petition for reconsideration of any order issued by the agency head within fourteen (14) days of the service date of that order. The agency head shall issue a written order disposing of the petition. The petition is deemed denied if the agency head does not dispose of it within twenty-one (21) days after the filing of the petition.

(5) Unless a different date is stated in a final order, the order is effective fourteen (14) days after its service date if a party has not filed a petition for reconsideration. If a party has filed a petition for reconsideration with the agency head, the final order becomes effective when:

(a) The petition for reconsideration is disposed of; or
(b) The petition is deemed denied because the agency head did not dispose of the petition within twenty-one (21) days.

(6) A party may not be required to comply with a final order unless the party has been served with or has actual knowledge of the order. If the order is mailed to the last known address of a party, the service is deemed to be sufficient.

(7) A non-party shall not be required to comply with a final order unless the agency has made the order available for public inspection or the nonparty has actual knowledge of the order.

(8) The provisions of this section do not preclude an agency from taking immediate action to protect the public interest in accordance with the provisions of section 67-5247, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: the petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4) Idaho Code.

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days: a) of the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **NOTICE THAT QUESTIONS CONCERNING THE SUFFICIENCY OF IGWA'S MITIGATION NOTICES ARE MOOT**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). Step 3 of the Methodology Order states that by May 1, or within fourteen days from issuance of a final order predicting a shortfall, "junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share" of any predicted shortfall. *Methodology Order* at 40.

On April 21, 2023, the Director also issued his *Final Order Regarding April 2023 Forecast Supply* ("April 2023 As-Applied Order"), wherein the Director predicted the Twin Falls Canal Company ("TFCC") would suffer a 75,200 acre-feet shortfall. *April 2023 As-Applied Order* at 3. To ensure TFCC was protected, the Director ordered that on or before May 5, 2023:

> [G]round water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user.

April 2023 As-Applied Order at 6.

On May 5, 2023, the Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of certain water districts[1] (collectively the "Districts"), filed a *Notice of Ground Water District Mitigation* ("Mitigation Notice").

IGWA's *Mitigation Notice* explained that "IGWA has three approved mitigation plans." *Mitigation Notice* at 2. IGWA asserted its first plan (the "2009 Storage Water Mitigation Plan") authorized the Districts to mitigate by delivering storage water to the Surface Water Coalition ("SWC"). *Id*. IGWA contends its second plan (the "Aquifer Enhancement Plan") authorized the Districts to "obtain mitigation credit" for various activities, e.g., fallowing acres irrigated by groundwater. *Id*. IGWA asserted its third plan (known as the "2015 Settlement Agreement Mitigation Plan") authorized the Districts to "obtain mitigation protection by complying with a 2015 settlement agreement between the Districts and the SWC. *Id*.

IGWA then advised that certain districts intended to mitigate under the 2009 Storage Water Mitigation Plan, while other districts intended to mitigate under the 2015 Settlement Agreement Mitigation Plan. *Id*. at 2–3.

On May 23, 2023, the Director issued an *Order Determining Deficiency in IGWA's Notice of Secure Water* ("Deficiency Order"). Of import here, the Director concluded IGWA's *Mitigation Notice* was deficient as it was improper for some Districts to mitigate under the 2009 Storage Water Mitigation Plan while others mitigated under the 2015 Settlement Agreement Mitigation Plan. *Deficiency Order* ¶¶ 2, 7, 9, 20, 21. The Director also determined IGWA's *Mitigation Notice* was deficient given IGWA's failure to tender fees to Water District 01 along with proof of legally enforceable contracts as required under the 2009 Storage Water Mitigation Plan. *Deficiency Order* ¶¶ 8, 9.

On June 1, 2023, IGWA submitted *IGWA's Amended Notice of Mitigation* ("Amended Mitigation Notice"), advising that IGWA would mitigate under the 2009 Storage Water Mitigation Plan. *Amended Mitigation Notice* at 3. IGWA also attached "copies of storage lease contracts secured by IGWA's member ground water districts totaling 77,714 acre-feet." *Id.*; *see also Amended Mitigation Notice* app. A. IGWA also objected to the Director's requiring IGWA to pay Water District 01's fees, but advised it had paid the fees notwithstanding its objection. *Amended Mitigation Notice* at 3.

On June 5, 2023, the SWC submitted *Surface Water Coalition's Response to IGWA's Amended Notice of Mitigation* ("SWC's Response"). The SWC argues IGWA's *Amended Mitigation Notice* is unclear whether IGWA members are agreeing to mitigate only for their proportionate shares, or instead for all ground water users as mandated under the 2009 Storage Water Mitigation Plan. *SWC's Response* at 2. The SWC further argues that IGWA's *Amended Mitigation Notice* fails to "address all of IGWA's storage water mitigation obligations for 2023", which include additional requirements beyond those articulated in the 2009 Storage Water Plan. *Id*. at 2–3.

[1] IGWA's submitted the Notice of Mitigation on behalf of: North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District. *Mitigation Notice* at 1.

On June 6, 2023, IGWA submitted a *Petition for Reconsideration of Order Determining Deficiency in IGWA's Notice of Secured Water* ("Petition for Reconsideration"), wherein IGWA requested that the Director "withdraw the new requirement that Water District 1 fees be paid before the Director will accept signed storage water lease or option contracts as proof of IGWA's ability to provide storage water as mitigation." *Petition for Reconsideration* at 1.

Also on June 6, 2023, IGWA submitted its *Reply to SWC's Response to IGWA's Amended Notice of Mitigation* ("IGWA's Reply"). In its reply, IGWA argued it was not required to mitigate for all ground water users under the 2009 Mitigation Plan, and further argued it was in compliance with all its mitigation obligations. *IGWA's Reply* at 2.

On June 12, 2023, the SWC submitted *Surface Water Coalition's Response to IGWA's Reply* ("SWC's Response to IGWA's Reply"). The SWC reiterated that "[i]f IGWA is relying on the [2009 Mitigation Plan] to mitigate, it must mitigate for all ground water users, not just its members . . . ." *SWC Response to IGWA's Reply* at 2. The SWC emphasized that "IGWA cannot ignore the comprehensive terms of the Settlement Agreement Plan and mitigate only with the [2009] Storage Water Mitigation Plan to satisfy its 2023 obligation." *Id*. at 5. The SWC also reiterated that IGWA must supply an additional 30,000 acre-feet in 2023 as a remedy for IGWA's breach in 2021. *Id*. 2–3.

On July 19, 2023, the Director issued the Department's *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*, as well an *Order Revising April 2023 Forecast Supply (Methodology Steps 5 & 6)* ("July 2023 As-Applied Order"). Of import here, in the *July 2023 As-Applied Order* the Director concluded that members of the SWC will not suffer a demand shortfall in 2023. *July 2023 As-Applied Order* at 9.

ANALYSIS

A matter "is moot if it presents no justiciable controversy and a judicial determination will have no practical effect upon the outcome." *Goodson v. Nez Perce Cnty. Bd. of Cnty. Comm'rs*, 133 Idaho 851, 853, 993 P.2d 614, 616 (2000). As noted above, the Director recently issued the July 2023 As-Applied Order, which found that no SWC members would suffer a demand shortfall in 2023. Because there is no demand shortfall, ground water users are no longer required to mitigate. Since ground water users are no longer required to mitigate, questions regarding the sufficiency of IGWA's *Mitigation Notice* or *Amended Mitigation Notice* no longer present a justiciable controversy and are therefore moot.

NOTICE

Having concluded that questions concerning the sufficiency of IGWA's mitigation notices are moot, the Director provides notice that the Department will not issue orders responding to *IGWA's Petition for Reconsideration of Order Determining Deficiency in IGWA's Notice of Secured Water* or *IGWA's Amended Notice of Mitigation*.

Dated this 20th day of July 2023.

GARY SPACKMAN
Director

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S RESPONSE TO CITIES' REQUEST FOR HEARING AND ORDER AUTHORIZING DISCOVERY**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby respond to the *City of Pocatello's, City of Idaho Falls', and Coalition of Cities' Request for Hearing and Order Authorizing Discovery* ("Request") filed on August 3,

2023. The Coalition requests the Director to deny the Cities' Request for the reasons set forth below.

BACKGROUND

The Director issued the *Fifth Amended Methodology Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") on April 21, 2023. The Cities challenged that order and filed several requests for hearing. *See Pocatello's Request for Hearing* (April 28, 2023); *Coalition of Cities' Amended Request for Hearing* (April 28, 2023); *City of Idaho Falls Challenge and Request for Hearing* (May 4, 2023). The Cities later filed additional statements of issues. *See Pocatello's Statement of Issues* (May 4, 2023); *Coalition of Cities' Statement of Issues* (May 4, 2023); *City of Idaho Falls Statement of Issues* (May 4, 2023). Notably, the Cities raised the following issues subject to the administrative hearing that was held from June 6-9, 2023:

> c) Whether the Surface Water Coalition's ("SWC") actual irrigated acreage was properly determined for use in determining reasonable in-season demand; . . .
>
> e) The reasonableness of Project efficiencies of the SWC members, trends in said efficiencies in recent years, and how the efficiency values are used in determining reasonable in-season demands;
>
> f) IDWR's failure to consider all sources of supply to the SWC;

Pocatello's Request for Hearing at 2; *see also Pocatello's Statement of Issues* at 2.

> b) IDWR's failure to properly identify the Surface Water Coalition's ("SWC") irrigated acreage used in the determination of reasonable in-season demand; . . .
>
> d) IDWR's failure to consider changes in the efficiency of the SWC's operations;
>
> e) IDWR's failure to consider all sources of supply available to the SWC;

Coalition of Cities' Amended Request for Hearing at 2.

> 4. IDWR's failure to consider changes and reasonableness of the project efficiencies of the SWC's operations; . . .

> 11. IDWR's failure to investigate whether the SWC members are using the water they divert efficiently and without waste, and in compliance with the terms of their decreed water rights;

Coalition of Cities' Statement of Issues at 2-3.

> 4. The reasonableness of Project efficiencies of the SWC members, trends in the efficiencies in recent years, and how the efficiency values are used in determining reasonable in-season demands;
>
> 5. Whether IDWR failed to consider all sources of water supply to the SWC; . . .
>
> 12. Whether IDWR's failure to investigate whether the SWC members are using the water they divert efficiently and without waste, and in compliance with the terms of their decreed water rights;

City of Idaho Falls Statement of Issues at 2-3.

The parties were allowed to address the above issues at hearing through both lay and expert testimony and through exhibits.[1] The parties also submitted post-hearing briefing on all issues that were raised, or could have been raised, at the hearing. *See generally, Cities' Closing Brief* (June 16, 2023). The Director issued the *Post-Hearing Order Regarding Fifth Amended Methodology Order* and the *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-season Demand and Reasonable Carryover* ("Sixth Methodology Order") on July 19, 2023.

The Sixth Methodology Order was issued as a "final" administrative order subject to reconsideration and/or appeal to district court. *See* I.C. §§ 67-5246; 67-5270 to 5272; *see also*, Explanatory Information to Accompany a Final Order (attached to the Director's Sixth Methodology Order).

[1] These issues are essentially the same issues identified in the Cities' present Request. *See Request* at 2 (i.e. "operate reasonably and without waste," "irrigated acreage," "supplemental groundwater" and "enlargement rights"). All of these issues address the Coalitions' use of water and the Cities had an opportunity to discover and present this information at the June hearing.

ARGUMENT

I. IDWR Already Provided a Hearing on the Cities' Issues and the Statute Does Not Provide for a Second Hearing.

The Cities have erroneously petitioned for an administrative hearing on the Sixth Methodology Order pursuant to Idaho Code § 42-1701A(3). The statute only allows an aggrieved person to have a hearing on a director's action or order when that person "has not previously been afforded an opportunity for hearing on the matter." *See* I.C. § 42-1701A(3). The Cities do not fall into that category. Instead, IDWR provided the Cities with an opportunity for hearing on the issues listed in their recent *Request for Hearing* June 6-9, 2023. Issues related to the SWC's reasonable use of water, irrigated acres, supplemental groundwater, and enlargement rights were all subject to the hearing on the Fifth Amended Methodology Order held before the Director this past June. The Director specifically addressed these issues in the Post-Hearing Order. *See Post-Hearing Order* at 17-23. Although the Cities may disagree with the Director's decision, their remedy is not a "second" administrative hearing. Since the Cities had an opportunity for a hearing on their issues, Idaho law does not afford them a right to a "second" hearing. The Cities' request should be denied accordingly.

Moreover, the Sixth Methodology Order was issued as a "final" agency order. Pursuant to section 42-1701A(4) the Cities' statutory remedy is judicial review of that order. Idaho's APA provides the right to ask for reconsideration and/or appeal that decision to district court. The Cities did not ask for reconsideration and have yet to appeal the Sixth Methodology Order, however IGWA did ask for judicial review. *See IGWA's Petition for Judicial Review* (Ada County Dist. Ct., Fourth Jud. Dist., Case No. CV01-23-13713, Aug. 16, 2023). Since the Director's Sixth Methodology Order is on appeal to the district court it is not subject to any

further administrative process or hearing, unless ordered by the court. *See* I.R.C.P. 84. The Cities' request for a "second" hearing should be denied accordingly.

II. The Sixth Methodology Order Updates the Fifth Methodology Order Based on Information Produced at Hearing.

Notwithstanding the Sixth Methodology Order was issued as a "final" agency order subject to reconsideration and/or judicial review, the Director updated the Fifth Order based upon information produced at hearing. In other words, the issues that the Cities seek to address with a hearing on the Sixth Methodology Order were already addressed in the June hearing. There is nothing new in the final order that would warrant an additional administrative hearing. The Cities' request in this regard is unduly burdensome and would cost the parties and agency time and additional resources without any legal basis.

Notably, the Director stated "[t]his Sixth Methodology Order relies on the same data included in the Fifth Methodology Order." *See* Sixth Methodology Order at 8, n. 8, at 9, n. 9, at 10, n .10, at 15, n. 13, at 24, n. 18, at 26, n. 20, at 28-29, n. 21 (emphasis added). All of this information was available to the Cities as of April 21, 2023. However, the Director did identify certain limited corrections to the Fifth Methodology Order:

> As discussed in footnote 12, during the June 2023 Hearing the Department identified an error in AFRD's 2018 diversion data. Hr'g T. vol. IV, at 173-74. This correction was resolved in his Sixth Methodology Order, which relies on the updated data. The updated data did not result in an appreciable increase in 2018's diversion value.

Sixth Methodology Order at 12, n. 11.

> In this Sixth Methodology Order, AFRD2's 2018 diversion value has been increased by 5,000 acre-feet. This increase was necessary to remedy the error committed by Department staff in calculating AFRD2's 2018 adjusted diversion value for the Fifth Methodology Order, which was identified during the June 6 Hearing.

Id. at 13, n. 12.

IDWR staff member Matt Anders addressed the above data correction during the June hearing. He was available for cross-examination by the parties and the Cities had a full and fair opportunity to rebut or contest this information if they disagreed with it. Moreover, the Cities had a full and fair opportunity to rebut and contest any of IDWR's updates to the Fifth Methodology Order that were carried over to the Sixth Methodology Order. Stated another way, there is nothing new in the recent order that was not subject to the June hearing on the Fifth Methodology Order. All of the Cities' issues identified in their *Request for Hearing* were either expressly raised or could have been raised at the June hearing and finally addressed in the Director's *Post-Hearing Order* which resulted in the final Sixth Methodology Order.[2]

Alternatively, and without waiving any right to contest the granting of such a hearing, if the Director grants the Cities' request then the hearing should be limited to the issue of the updated data regarding AFRD2's 2018 diversion volume. The Director has such discretion and has limited review of amended methodology orders in that fashion before. This is the only change in the Sixth Methodology Order that could even be considered subject to another hearing. *See Order Limiting Scope of Evidence and Offering Witnesses (Methodology Order)* (May 21, 2010).

Similar to the request for hearing, the Director should deny or limit the Cities' request for discovery. Any issues that were already addressed at the hearing on the Fifth Methodology Order would be beyond the scope of discovery regarding a hearing on the additional data regarding AFRD2's 2018 diversion volume. Moreover, the Cities' request would be unduly

[2] The Cities have requested judicial review of the July 19, 2023 *Post-Hearing Order*. *See Notice of Appeal and Petition for Judicial Review* (Ada County Dist. Ct., Fourth Jud. Dist., Case No. CV01-23-13238, Aug. 16, 2023). It is anticipated that this appeal will be consolidated with IGWA's appeal of the Sixth Order.

repetitious and burdensome to the SWC in both time and expense. The Director should deny or limit the request accordingly.

CONCLUSION

The Cities' request for hearing on the Sixth Methodology Order is an impermissible attempt at a "second" hearing not authorized by statute. Moreover, Idaho law does not allow an agency to hold a "redo" administrative hearing of a final agency order that is pending on appeal to the district court. Since the Cities' issues were already addressed at the underlying hearing held in June, there is no basis to grant a second hearing on the Sixth Methodology Order.

The Coalition respectfully requests the Director to deny or limit the Cities' request for hearing and an order authorizing discovery accordingly.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S RESPONSE TO CITIES' MOTION FOR CLARIFICATION AND RECONSIDERATION**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby respond to the *Motion for Clarification and Reconsideration of Denial of*

Request for Hearing and to Engage in Discovery ("Motion") filed on September 5, 2023.[1] The Coalition requests the Director to deny the Cities' Motion for the reasons set forth below.

BACKGROUND

The Sixth Methodology Order was issued as a "final" administrative order subject to reconsideration and/or appeal to district court. *See* I.C. §§ 67-5246; 67-5270 to 5272; *see also*, Explanatory Information to Accompany a Final Order (attached to the Director's Sixth Methodology Order). The Cities filed a notice of appeal and petition for judicial review concerning the Director's related *Post-Hearing Order*, another order issued as part of the matter resulting in the Sixth Methodology Order. *See City of Idaho Falls et al. v. IDWR*, Fourth Jud. Dist., Ada County Dist. Ct., Case No. CV01-23-13238 (appeal filed August 16, 2023). IGWA filed a notice of appeal and petition for judicial review of various orders as well, including specifically the Sixth Methodology Order. *See IGWA v. IDWR*, Fourth Jud. Dist., Ada County Dist. Ct., Case No. CV01-23-13173 (appeal filed August 16, 2023). The Coalition of Cities and the City of Pocatello filed notices of appearance in that case. The two appeals are pending in district court and it is anticipated the cases will be consolidated.

ARGUMENT

I. The Director Properly Denied the Cities' Request for Hearing.

The Cities request clarification of the Director's Sixth Methodology Order claiming "no hearing has actually been held on the *Sixth Methodology Order*." Motion at 2-3. Yet, the Cities' feigned ignorance about the order is merely form over substance. The Cities fully participated in the contested case and administrative hearing that resulted in the issuance of the Sixth Methodology Order. They cannot dispute this fact. There is no basis to hold a second hearing

[1] The motion was filed the Coalition of Cities (cities of Bliss et al.), the City of Idaho Falls, and the City of Pocatello.

on the Sixth Methodology Order that fully addressed all of the information either presented at or before the administrative hearing. As such, the Director properly denied the requested hearing. *See Order Denying Request for Hearing and Motion Authorizing Discovery* at 2-3.

Moreover, the Cities have appealed the Director's *Post-Hearing Order* that addresses the issues raised on the Fifth Methodology Order, including the updated data the Director included in the Sixth Methodology Order. Although the Cities had a right to appeal the Sixth Methodology Order they failed to do so. Regardless, all of the Cities except Idaho Falls have appeared in IGWA's appeal of the Sixth Methodology Order.[2] Consequently, there is nothing to clarify and the petitions for judicial appeal will proceed pursuant to Idaho's civil rules.

II. The Director Properly Denied the Cities' Request for Discovery.

The Cities have also requested the Director to reconsider the denial of their motion to authorize discovery. *See* Motion at 2-3. Since the request for hearing was denied, the request to authorize discovery was properly denied as well. The Cities misconstrue this matter as a "continuing contested case" with no end. Motion at 2. Although the Director's methodology regarding the SWC delivery call may be updated at some point in time, that does not mean the prior contested cases resulting in "final orders" that have been appealed or are currently on appeal to the District Court are continuing *ad infinitum* as the Cities suggest. To find otherwise would keep the parties in a perpetual state of discovery, motion practice, and litigation, without any culminating hearing or end.[3] Such a scenario has no basis in statute or rule and would be unduly burdensome and mire the parties in endless litigation expense.

[2] Whether the City of Idaho Falls will file a notice of appearance is unknown. If the cases are ultimately consolidated it may not matter as all parties will be participating.

[3] It is curious why the Cities seem determined to re-litigate prior contested cases and outcomes in the face of their approved mitigation plan for the SWC delivery call and safe harbor from curtailment pursuant to the CM Rules. The request for discovery is unwarranted and would be overly burdensome in the context of what has already

Finally, the Cities' argument that they could not "adequately prepare" for the prior hearing is also erroneous and does not support their present reconsideration request. These arguments have been previously addressed by both the Director and the District Court. The Cities' continued efforts to "redo" prior contested cases is unwarranted and was properly denied by the Director. Since the final agency orders are presently on appeal to the district court, the agency should refrain from restarting contested cases as requested by the Cities.

CONCLUSION

The Cities have pointed to no new authority or information that would warrant reconsideration of the Director's August 23, 2023 order. The Coalition respectfully requests the Director to deny the Cities' Motion accordingly.

DATED this 19th day of September, 2023.

Exh 118 - 20230116 SWC Comments to IDWR Re: Methodology Update	219	230

THE HEARING OFFICER: Welcome everyone, old acquaintances. I have to characterize most of you in that category. We're set up a little differently than we normally set up. And I'm not sure I like it. Many of you seem to be in distant view from this location. So it seemed to me, we needed at least in the past have been a little more intimate in another set up. We arranged the furniture this way, because we have some people participating electronically online in remote locations, and we want to make sure that everybody can see the screens, including the Hearing Officer and reporter. So that's the reason for the change.

This is the time and place scheduled for a hearing regarding the issuance of a Fifth Methodology Order in the Surface Water Coalition delivery call case. And probably the first matter of business is to introduce everyone here and call roll.

So let's start, and we have a court reporter here, that is familiar to many. Colleen, if you would introduce yourself. And then we'll go across the front and go row by row.

THE REPORTER: Colleen Doherty, with M&M Court Reporting.

THE HEARING OFFICER: I might just add that Colleen has been participating in enough of these

hearings that she probably is developed some expertise in the vernacular of water. And so we appreciate M&M Court Reporting and their help.

I'm Gary Spackman, the Director of the Idaho Department of Water Resources.

MR. WOOD: Pete Wood, attorney for the Department.

THE HEARING OFFICER: Let's start with you, Travis, and then wind through.

MR. THOMPSON: Travis Thompson with Marten Law, attorney for A & B Irrigation District, et al.

MR. FLETCHER: Kent Fletcher, attorney for Minidoka Irrigation District, and American Falls Reservoir District No. 2.

MR. BRICKER: Max Bricker with Somach Simmons & Dunn, on behalf of the City of Pocatello.

MS. KLAHN: Sarah Klahn with the Somach Simmons & Dunn, also for the City of Pocatello.

MR. BROMLEY: Chris Bromley with McHugh Bromley for the Coalition of the Cities, the Cities, et al.

MR. HARRIS: Rob Harris with Holden, Kidwell, Hahn & Crapo, on behalf of the City of Idaho Falls.

MR. CONTOR: Bryce Contor at Rocky Mountain Environmental with the Idaho Ground Water District.

MR. SULLIVAN: And I'm Greg Sullivan with Spronk Water Engineers on behalf of the ESPA Cities, and the City of Pocatello.

MR. JOHNS: I'm Skyler Johns with Olsen Taggart, and I represent Bonneville-Jefferson Ground Water District.

MR. ANDERSON: Dylan Anderson, Bingham Ground Water District.

MR. BUDGE: TJ Budge with Racine Olson, Idaho Ground Water Appropriators.

MS. PATTERSON: Elisheva Patterson, Racine Olson, also with the Idaho Ground Water Appropriators.

MR. SIMPSON: Good morning. John Simpson with Marten Law, with A & B Irrigation District, et al.

MR. COLVIN: Dave Colvin with LRE Water representing IGWA.

MR. RIGBY: Jerry Rigby, Ribgy Andrus & Rigby, representing three of ground water districts in IGWA.

THE HEARING OFFICER: Then in the back if you'll speak up loudly.

MS. SUKOW: Jennifer Sukow, Idaho Department of Water Resources.

MS. FERGUSON: Kara Ferguson, Idaho Department of Water Resources.

MR. ANDERS: Matt Anders, IDWR.

MR. JACKSON: Al Jackson with the Bingham Ground Water District.

THE HEARING OFFICER: Thank you, Al.

Okay. Now, we need to call roll for those who are participating remotely. So let's start. And I'll just look at the screen. Sarah, are you there?

MS. McHUGH: Thank you. You mean, Candice.

THE HEARING OFFICER: Candice, did you speak?

MS. McHUGH: Yeah. I wasn't sure if you meant Sarah or Candice. Because we have Candice and Sophia, I think who are remote.

THE HEARING OFFICER: And we have some others who are listening in. I don't think I'll call the roll for all of those folks. Are there other attorneys who are participating? And we have at least one expert witness participating.

MS. SIGSTEDT: Sophia Sigstedt with Lynker on behalf of IGWA.

THE HEARING OFFICER: Thank you, Sophia.

Okay. I don't know unless there is a need for me to call for others who may be listening in. So the instructions that we sent out regarding electronic participation would be that Candice McHugh and Sophia will be participating in the hearing and either will examine or offer testimony remotely. Everyone else is

just listening in, and those folks are not participants in the hearing. And you will be muted for the entirety of the hearing. So that's the instruction. And it's a management requirement for me. Otherwise we would have too many people speaking, and those who are not at least officially parties to this matter.

Okay. Let me just check and see if we have everyone. I know there are attorneys --

MS. McHUGH: Director, this is Candice. Can I ask --

THE HEARING OFFICER: Yes, Candice.

MS. McHUGH: I don't know when everyone is speaking if they make objections or something like that. Travis and Kent were fairly, I could hear them fairly well, but Max, Chris, I couldn't hear them, or Jerry Rigby very well. So just kind of wanted to make sure people were by the mics.

THE HEARING OFFICER: Okay. Well, Candice, since you raised this issue. So we have a room microphone that's set up, I think overhead for the attorneys. But when an attorney is examining a witness, we would like you to come forward. There is a table in front. And you can deposit your exhibits or other materials on the table. You have a choice of either examining from the lectern or the table, itself. There

is a microphone set up in each of those. And the witness will be here to my right.

So hopefully the physical arrangement will promote a verbal dialogue that everybody can hear. But if there are objections from the attorneys, we'll ask that you speak up very loudly, so that the microphone will pick up your voice. And so those participating remotely can hear, and the court reporter can record the objection and any of the exchange. So we'll have to be mindful of the need to be outspoken in these discussions today.

All right. Let me just look at this list again. The Bureau of Reclamation is not represented, but they've been observers more than anything. Okay. I think we have all of the parties represented today.

All right. There are some preliminary matters that we need to talk about. And some either requests or petitions that are pending in front of the Hearing Officer right now. So there is a request for issuance of a subpoena to Mat Weaver and Tony Olenichak to testify as witnesses -- hello -- maybe just a vocal glitch.

And so there is a request that the Hearing Officer or the Director issue subpoenas for Mat Weaver and Tony Olenichak. And because of the timing of those

requests, and because of the nature of the testimony at least is as anticipated. I have prepared or am preparing an order denying that request to issue subpoenas to those two folks. And I'll issue that shortly and will distribute it by hand.

I also have a motion to limit testimony that's pending. And the ground water users, I don't think have had a response or an opportunity to respond. That motion I think came in within the last couple of days. Is there some desire on the part of the petitioners and the ground -- the other -- well, I shouldn't say the ground water users, although I think that's who might oppose the motion.

Petitioners, do you wish to orally present any information at this stage?

MR. THOMPSON: This is Travis Thompson, Director. Just briefly. We filed this yesterday after looking at the list of the witnesses, proposed testimony, and exhibits. And I guess similar to prior hearings in this matter where parties have requested a hearing on the Director's order, in this case the Fifth Order and the As-Applied Order, we think that the scope of that hearing should be limited to those issues identified there.

It looks like to me that we're attempting to

go back and redo an administrative hearing we had in 2008. That was then subject to a final order and then judicial review. We attached a copy of Judge Wildman's decision to Exhibit A to our motion that comprehensively addresses the methodology.

So that was the basis for our motion. I don't have real specifics right now. But I guess as we go through this hearing, we would like a standing objection that if we go beyond the scope of those two orders and issues that are pertinent before the Department, that we would limit that. Thank you.

THE HEARING OFFICER: Responses? Mr. Budge.

MR. BUDGE: Thank you, Director. TJ Budge on behalf of the IGWA, Idaho Ground Water Appropriators. I guess to begin, the parties did file their statements of issues in this case a month ago. So it's a bit peculiar that we got this served on us the day before the hearing as we're traveling to Boise. We have not had a lot of time to prepare for it. But I do want to share just a few thoughts.

If we're going to follow the Coalitions line of reasoning, then the transition from a transient steady state to a transient state model is res judicata. A transient state model was at issue in the earlier hearing in the context of carryover storage. And so

it's certainly something the parties were aware of. It was an issue that could have been litigated in that proceeding. And if that is barred by res judicata, then that component of the Fifth Methodology Order must, you know, be reversed.

Also, acreage was litigated in that prior proceeding, and the Department accepted the acreage evidence presented by the junior ground water users. We were successful in that. And that would also be res judicata.

So if we're going to go that way, we really have to identify what issues are on the table, because it's not a one-way street. You don't get to change just the components that you like, and then claim it's res judicata, so the components you don't like. That's probably not the right approach. And the reason is is that the methodology order is required by law to be based on the best science available. And science changes, facts change, circumstances change. It's not a traditional court order that is locked in place forever. It's more of a living document.

And so if we're going to look at more recent data, if we're going to consider changes in science, then we have the ability to look at all components of the methodology and see, is there a compelling reason to

change any of the components based on experience, science, and recent data.

So for those reasons, we'd ask that the court deny the motion, or the Director deny the motion.

THE HEARING OFFICER: Other responses? Mr. Harris.

MR. HARRIS: Thank you, Director. Ralph Harris on behalf of the City of Idaho Falls. Just to add to what TJ said, we haven't had the chance to research the matter in depth.

But I would draw the Director's attention to the Idaho Supreme Court case of Erickson versus Amoth, which provides the following. Generally the doctrine of res judicata extends only to facts and conditions as they existed at the time the judgment was rendered. And ordinarily res judicata does not apply where there were changed conditions and new facts, which did not exist at the time of prior judgment.

The general view is that where after the rendition of a judgment, subsequent events occur creating a new legal situation, or altering the legal rights relations of the litigants, the judgment may thereby be precluded from operating as an estoppel.

As Mr. Thompson mentioned, the original order was issued in 2008. There have been change

circumstances. In fact, I believe you indicated that was one of the primary reasons you were looking at updating the Fifth Methodology Order. And so for that reason, we think all issues are on the table here today. Thank you.

THE HEARING OFFICER: Other statements?

MR. ANDERSON: Yes.

THE HEARING OFFICER: Dylan, Mr. Anderson.

MR. ANDERSON: Just briefly, Director. One of the things that was called out specifically was something that we intend to introduce as part of Bingham Ground Water refers to, you know, the economic impacts. And the Clear Springs Food, Inc. case was cited in that. And I just wanted to just go on into that case. It introduced, or the Springs Food case quoted the AFRD case.

And it just said somewhere between the absolute right to use a decreed water right and an obligation not to waste it, and to protect the public's interest in this valuable commodity lies an area for the exercise of discretion by the Director. In that sense, the court recognized some discretion by the Director to look at the reasonableness of diversions, look at the reasonableness of what's required by the senior water right holder. I think that the changes contemplated in

the Fifth Methodology certainly would change the reasonableness required by the Department in a sense if you are potentially curtailing ten-fold acreage. The economic impact is increased ten-fold, or actually even exponentially more than ten-fold as it compounds. And so I think that is certainly relevant data for the Department to have, and to understand, and consider in their reasonableness calculations.

The sections that were quoted are not necessarily pertaining to limiting any economic information before the Department. And certainly the Supreme Court didn't deem it inadmissible or completely irrelevant. They just simply didn't use that information for that particular argument.

So we'd join in the rest of the arguments already stated. Thank you, Director.

THE HEARING OFFICER: Other statements?

Okay. As I understood what you presented, Mr. Thompson, you were asking for a standing objection. As I look through the list of witnesses and also the issues, it seems to me that many of the witnesses may be called to testify about the economic impacts of curtailment. And as I read -- well, first of all, as I look at the methodology order and component facts that contribute to the development and to the writing of the

Fifth Methodology Order, economics was not a part of the underlying facts that were considered. And, in fact, the decisions as I read them that have been issued, stated that economic impact and a comparative analysis of economics is not part of prior appropriation administration.

And so I guess what I'm trying to say is, the testimony that I receive in this particular hearing will be limited to the factual components that were a part of the development and writing of the Fifth Methodology Order. And economics were not a part of those facts.

And, in fact, as I read the court decisions, the court has said that the economic comparison would actually frustrate and thwart the administration of water under the prior appropriation doctrine. And so I will cut short in the examination, presentation on the respective economic benefits or the economic impacts of possible curtailment under the Fifth Methodology Order.

Now, there may be other areas that exploration that are outside of the methodology order, itself, and those areas if there is examination regarding those areas, I will allow objections. And will rule on those objections depending on the relevance to the Fifth Methodology Order.

So I'm trying to at least set some boundaries

as to the scope of examination. And there may be other areas beyond economics. But it seemed to me that at least the focus on economic issues in looking at the list of witnesses and the issues is not appropriate in this particular hearing. Okay?

All right. I don't know that I have any other issues that are pending right now. There may be some additional motions that the parties want to offer, and bring before the Hearing Officer at this point. Are there motions, and pre-hearing motions that the parties wish to offer up?

Wow. You're an agreeable crowd.

All right. Let's talk about exhibit numbering. There is a little confusion about it. There were specific ranges of numbers that each of the parties were assigned. And I think there has been some adjustment in that numbering.

Mr. Budge, you may have gone over your range that was my understanding. But I think the parties had recognized that renumbering. But I think just recently there has been an attempt to try to consolidate exhibits.

And I just want to know how the parties want to address that attempted consolidation.

Elesheva.

MS. PATTERSON: Good morning, Director. Yes, as you can see behind you, there is a lot of paper. And so IGWA filed its initial disclosures. We exceeded our allotted range. And so we also used the 800 numbers. Later after all of the initial disclosures were made, our staff went through and tried to identify common exhibits and numbered those as 900, which were unique, in an attempt to save paper and try to simplify things. And so we have disclosed that to all the parties. I have not received any objection to the amended pre-trial disclosures. But will respond to them if there is any objections.

THE HEARING OFFICER: What do the parties want to do?

Mr. Fletcher?

MR. FLETCHER: Director, it might be helpful to just recite, if you remember, I don't know if you remember the ranges that go to each classification. So that the Director is aware of that.

MS. PATTERSON: IGWA was assigned the 100 to 199 numbers. And so we do have documents that range from Exhibit No. 100 to 199. Some of those have been removed. And now are labeled as common exhibits. And then we also have exhibits labeled 800 to 837. And again, some of those in the amended pre-trial disclosure

were removed. And so this will not be a continuous list, but all documents are uniquely identified for the record. And common hearing exhibits --

MS. McHUGH: Elesheva, this is Candice. Did you send us that? In my examination, I just have four exhibits that I refer to in the 300 series. I'm guessing that they have now been renumbered to the 900 series. But I think I'm just going to keep them with the 300 series, because I'm at a little bit of disadvantage not having paper to be able to look through, or I could just tell you what they are, and someone could tell me if they are the 900 series, and I can change the exhibit numbers, but...

MS. PATTERSON: So that is one issue --

MS. McHUGH: I think that might be confusing.

MS. PATTERSON: That is one issue with the common exhibits. So IGWA did send out an amended exhibit list where we had removed from our exhibits those that became common. But I don't know that the Cities and other parties were able to do so. But I think as long as we're all identifying, you know, our submitted document, we can keep the record straight.

And, Candice, you can use the common exhibits if you would like. And I can try to send you an updated numbering for those to keep things simple.

THE HEARING OFFICER: Let me just add that Sarah Tschohl, a paralegal in our office, she has compiled a list of exhibits for me. And she has identified those exhibits that were also designated as common exhibits.

And for the benefit of Candice McHugh, I don't show any of the McCain Foods exhibits as being common exhibits at least in my summary.

MS. PATTERSON: I think that's correct. We had some exhibits that were common with Bonneville-Jefferson and with the Cities exhibits. But I don't think we had any in common with the McCain Foods or the Coalition.

THE HEARING OFFICER: So, Candice, in answer to your question, at least in my summary, your exhibits are numbered 600 through 604. And none of them are common exhibits.

MS. McHUGH: Thank you, Mr. Director. First of all, well, I think the Amalgamated's were 600 through 604, or I mean McCain's. And Amalgamated's were 700 to 703. But I will be examining Jennifer using Coalition exhibits 300, 301, 305, and 318. And I think those are probably Coalition of Cities or -- yeah, the Cities Exhibits 300, 301, 305, and 318. And those are the four exhibits I was specifically talking about.

THE HEARING OFFICER: Well, some of those are common.

MS. McHUGH: Right.

MS. PATTERSON: Candice, if you want to refer to -- Candice, if you want --

MS. McHUGH: Tell me what number to refer to, and I'm good with it.

MS. PATTERSON: I think since we'll be moving into Jennifer Sukow's --

(Interruption had in the proceeding.)

THE HEARING OFFICER: Sarah Tschohl, are you there? Somebody wasn't muted.

MR. HARRIS: I think it's Katie, whoever Katie is.

THE HEARING OFFICER: I don't know who Katie is.

MS. PATTERSON: Yeah, Katie, please mute your mic.

THE HEARING OFFICER: Sarah, can you impose your draconian hand and mute Katie?

MS. PATTERSON: I think she addressed the issue.

THE HEARING OFFICER: Okay.

MS. PATTERSON: Candice, what I was going to suggest since we're starting out with Ms. Sukow first,

and your exhibits that you referenced for the Cities are responsive to that portion of the testimony. Please use those. And we'll just, if we have follow up, we'll refer to the Cities exhibits as IGWA reserve the right to use any exhibits produced by any party.

THE HEARING OFFICER: Okay. So without any objection, we'll introduce, if we can, the numbered exhibits that have been identified as common with the numbering identified by IGWA in the 900 series. Is that acceptable to everyone? And I could supply this cross-reference list if people want this list. If it would be beneficial, we could copy it?

MR. BROMLEY: That would be.

MS. KLAHN: Yes.

THE HEARING OFFICER: So at the first break, I'll ask to have this copied and distributed to all of the parties. And we'll be able to refer to a common list of exhibits if that's okay, Elesheva?

MS. PATTERSON: Yes. Thank you, Director.

THE HEARING OFFICER: Mr. Thompson.

MR. THOMPSON: Just to clarify. We're stipulating to the numbering, and not the actual exhibits themselves; is that correct?

THE HEARING OFFICER: That's correct.

MR. THOMPSON: Okay.

THE HEARING OFFICER: My next question was, have the parties stipulated to the admission of any of the exhibits that have been identified? And if they haven't, maybe there is an opportunity as we go through to stipulate to the admission of some of those. It would speed up the hearing significantly if for every exhibit, we didn't have to move for admission.

MR. THOMPSON: I think that would be our intent to try and do that. We haven't gone through the entire list of the other parties yet. But the ones we'll admit to, we'll stipulate to.

THE HEARING OFFICER: Okay. All right. I have in front of me -- I'll change subjects and not talk about exhibits, unless there is more discussion regarding the exhibits, numbering, and possible stipulation.

All right. I want to move to a proposed witness schedule that has been offered to the parties. And at least my understanding is there has been some discussion about the witnesses, and the order in which they'll be called. And I want to refer back to a discussion about the days that were scheduled for hearing.

It was my intent that we would attempt to finish this hearing in four days, on Friday. And then

Saturday was reserved for any spillover. And I have on this list six witnesses for Saturday, the 10th of June. And I want everybody to know, that I intend to try and finish on Friday. Because I don't want to have an incomplete hearing come Saturday.

And so I will compress this list of witnesses and the days that the witnesses will appear and testify. And if I find that we're getting behind, I will hold you over. And we will start early. Because I want to ensure that we finish, and at least attempt to finish by Friday.

And if you can keep me apprised of some of these witnesses who may or may not testify as we proceed through the hearing, I would appreciate it. I don't want to hold you over, and then finish on Thursday at noon. It would be great, I guess. But I want everybody to know that I want to finish. And my goal is to finish on Friday.

MS. KLAHN: Mr. Director.

THE HEARING OFFICER: Yes.

MS. KLAHN: Sarah Klahn for the City of Pocatello. On the list that you have, Sophia Sigstedt and Greg Sullivan, the order there is flipped. So Mr. Sullivan will go before Sophia, and after Mr. Barlogi, just an FYI.

THE HEARING OFFICER: That would be great. And I appreciate the parties honestly coordinating and figuring out who will be available on which days, so that we can accommodate people as best we can. So I appreciate everybody's efforts. And there may need to be some adjustment because of availability or unavailability.

We had to get Jennifer Sukow excused from jury duty by the way, and issue her a subpoena. So that she could then go present it to the folks at the county, so that she could be here.

Candice, were you wanting to say something?

MS. McHUGH: Yes. I'm sorry. I think there is just a slight delay. And you kind of addressed it. I just wanted to note for the record that McCain's witness, Scott King, and Amalgamated's is Dean Delorey, they are available Friday. So they need to go on Friday. Mr. King might have a little more flexibility, but he's checking his schedule. But Mr. Delorey does not. So regardless, I would ask that they be set for Friday. I expect their testimony to be less than ten minutes. So it would be really quick.

THE HEARING OFFICER: Okay. I also notice on the screen that Katie continues to appear. And I'm assuming that means that she is not muted.

Candice is now there. But Katie was on the screen earlier. So I would ask whoever Katie is, will you please mute your microphone.

And, Sarah Tschohl, if you can control with the Draconian hand, I would appreciate it as well.

Mr. Fletcher, you had a comment.

MR. FLETCHER: I just wanted to clarify the switch in witness order. Is Greg Sullivan going before Delorey?

MS. KLAHN: No. No. Sophia and Greg are switching. That's all.

MR. FLETCHER: Okay. Thank you.

THE HEARING OFFICER: Okay.

MR. THOMPSON: Mr. Director, one point on that list. We do have Justin Temple at some point, probably Friday, not very long, ten minutes. But that will be added.

THE HEARING OFFICER: I expect to have some flexibility in this witness schedule. Particularly if I'm trying to compress. So if the parties will just keep me apprised of what's happening, and keep everybody else apprised, then we'll be able to keep to a semi-rigid schedule. Again, I appreciate everybody's efforts.

Okay. Are there other matters we need to take

up this morning?

Let's talk about the order of questioning. So because this is a hearing that a Hearing Officer and the Director initiated, and because at least the Department's witnesses do not have documents that they prepared, and specifically for the hearing, itself. Often the Hearing Officer will ask for a staff memo.

We will have then the Department witnesses testify at least as in timing as closely as possible to the beginning of the hearing. Then what I'll do is I'll ask the Surface Water Coalition to question the Department witness shortly after to the extent that there are questions. And then allow the other parties to question the Department witness. And then we'll circle back and allow what I would characterize as redirect based on the questions that are asked.

Now, if that's not an order that the parties want to follow, I want to hear about it today. Particularly from the Surface Water Coalition, if you think it compromises your ability to question the witnesses.

MR. FLETCHER: Just a comment. Mr. Director, most of the questions are going to be raised by the ground water users. And until they ask their questions, we can try to cover the areas we think they're concerned

about it. But it might be more efficient to let them question the witness, and then let us address those issues.

THE HEARING OFFICER: And I don't oppose your proposal.

MR. FLETCHER: I think that would be more efficient. I mean, obviously, we're not the ones contesting most of the issues in the matter.

THE HEARING OFFICER: Any other thoughts?

All right. Well, based on your suggestion, Mr. Fletcher, we'll have the Department witness introduced. And some preliminary information brought into the record or offered by the deputy attorney general here today, Pete Wood. And then we'll ask the ground water users and the other parties aligned with them to question the Department witness. And then there will be an opportunity for questioning.

And then I don't know how to characterize this, whether it's redirect or recross. It's really not either, I suppose in the examination of the Department witnesses. But the ground water users will have two opportunities. And the Surface Water Coalition will have two opportunities. And then we'll be done.

MR. FLETCHER: Thank you.

THE HEARING OFFICER: Fair enough?

MR. FLETCHER: Yes.

THE HEARING OFFICER: And then I would expect with the other witnesses, that we follow a more traditional method of examination. Where the witness testifies, and then there is an opportunity for cross-examination, and redirect, and recross. So it's only with the Department witnesses that I think there is an anomalous presentation of testimony.

Okay. Other matters we need to talk about?

Pete, any matters?

MR. WOOD: Not that I can think of.

THE HEARING OFFICER: Okay. I'm ready for the first witness. Again, let me remind everybody, as you examine, I want you to come forward. Assume either a seat at the table or standing at the lectern, and then you can examine from either place. The witness will be here, seated to my right.

TJ?

MR. BUDGE: Yes. Director, there is one more pretrial matter I forgot about. I think counsel did as well. But counsel for the parties did stipulate that the expert witnesses would be qualified as such without needing to go through, you know, their background, and demonstrate their capabilities to testify as experts.

THE HEARING OFFICER: Yes. Thanks for raising

and identifying the stipulation. So I will accept the stipulation. I'm well acquainted I think with most of the experts, if not all of the experts, who will testify today. And I appreciate the pre-hearing stipulation that will encourage efficiency.

MR. FLETCHER: Yes.

THE HEARING OFFICER: Mr. Fletcher.

MR. FLETCHER: On that issue, Mr. Director, we stipulated to a designated list of expert witnesses. We did not stipulate to a Mr. Olson. And I'm not sure we stipulated to Jaxon for everything as an expert on everything he put in his report, Jaxon Higgs. But the rest of the experts I can think of, I believe we can stipulate to their admission as experts. And the ground water users clarified that to be to the matters contained in their reports.

THE HEARING OFFICER: Okay. Clarification accepted, TJ.

MR. BUDGE: Yes.

THE HEARING OFFICER: All right. Anything else?

Jennifer Sukow, if you'll come forward, please.

JENNIFER SUKOW,

first duly sworn to tell the truth relating to said

cause, testified as follows:

THE HEARING OFFICER: Thank you. Please be seated.

Mr. Wood, you may examine Ms. Sukow.

DIRECT EXAMINATION

QUESTIONS BY MR. WOOD:

Q. Hello, Ms. Sukow. Can you please state and spell your name for the record.

A. Jennifer Sukow, J-e-n-n-i-f-e-r, S-u-k-o-w.

Q. And what is your educational background?

A. I have a bachelor's degree in environmental geology and technology from the University of North Dakota, and a master's of science in civil engineering from Utah State University.

Q. And you are a licensed professional engineer and geologist in Idaho; is that correct?

A. Yes.

Q. And you were currently employed at the Idaho Department of Water Resources?

A. Yes.

Q. And how long have you worked for the Department?

A. About 15 years.

Q. And you are currently a technical engineer for the hydrology section?

A. Yes.
Q. And how long have you been in that position?
A. About 13 years.
Q. I would like to turn to the Fifth Methodology Order. Are you familiar with that document?
A. Yes.
Q. And some of the data in the Fifth Methodology Order you know a lot about; is that right?
A. Some of it, yes.
Q. And you played a role in developing some of that information?
A. Some of the findings of fact, yes.
Q. And that is why the Department has selected you to be a witness today; is that correct?
A. That's my understanding.
Q. And you were aware that on May 5th, 2023, the Director issued a notice advising the parties of two topic areas that you might testify today about?
A. Yes.
Q. And those two topic areas are the following: The first is steady state modeling versus transient state modeling, simulations for the ESPA. And the second is calculations of curtailment priority dates for the Surface Water Coalition's delivery call. Does that sound correct?

A. Yes.
Q. And do you have any concerns that you're unqualified to discuss those topics here today?
A. No.
MR. WOOD: The Department has no further questions at this time.
THE HEARING OFFICER: Thank you, Mr. Wood.
All right. Ground water users, is there an order of examination that you prefer?
MS. McHUGH: Mr. Director, this is Candice. I think I'm slated to go first.
THE HEARING OFFICER: Okay. Ms. McHugh.
MS. McHUGH: Just for some efficiency, could I have the witness handed the Coalition of Cities' exhibits No. 300, the binder for that?
MR. WOOD: Was it 300 through 313?
MS. McHUGH: 300 and then through 318.
THE HEARING OFFICER: The witness has the documents in front of her.
MS. McHUGH: Okay. Thank you.

CROSS-EXAMINATION

QUESTIONS BY MS. McHUGH:
Q. Good morning, Jennifer. Candice McHugh on behalf of the Coalition of Cities and McCain Foods. If you could look at the binder, and grab Exhibit 300.

(Exhibit 300 marked.)

Q. (BY MS. McHUGH) If you could identify Exhibit 300?

MR. THOMPSON: Director, this is the --

THE HEARING OFFICER: Just a moment, Candice.

MS. McHUGH: Okay.

MR. THOMPSON: This is our first overlap. I think this is IGWA's common 918. And if you just want to use that once, or admit it twice in the record. I'm confused on what we're going to do?

THE HEARING OFFICER: So should we refer to this as 918?

MS. McHUGH: Okay. We can --

THE HEARING OFFICER: And one of the concerns I have is that the exhibits, themselves, and the documents, themselves, don't bear those numbers; do they? It's only --

MS. PATTERSON: Not the 900s.

MR. THOMPSON: The 900s do. They are all Bates stamped.

MS. KLAHN: We could substitute.

MS. McHUGH: The other option, not to belabor the record, but if you give her Exhibit NO. 918, 919, and 920. And if someone could tell me what 900 series the April 2022 forecast supply order is, I could also

use that 900 number. But I just don't -- from the descriptions, from IGWA's descriptions, I can't tell what 900 number that is.

MR. BUDGE: So Candice 918 is the Fifth Methodology Order.

MS. McHUGH: Uh-huh.

MR. BUDGE: And 919 is the As-Applied Order.

MS. McHUGH: Right. I'm looking for -- I know that. I need the April 2022 As-Applied Order number in the 900 series.

THE HEARING OFFICER: All right. Let's go off the record.

(Off the record.)

THE HEARING OFFICER: Are we ready to go back on? We're recording again. Thank you, Colleen.

All right. Candice, if you will refer to the exhibits you want the witness to review. And we're expecting exhibits in the 300 series.

MS. McHUGH: Great. Thank you.

Q. (BY MS. McHUGH) Good morning, Jennifer. We'll start again. In front of you, you should have Exhibit No. 300. Can you identify that document?

A. It's the "Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover."

(Exhibit 301 marked.)
Q. (BY MS. McHUGH) Okay. And if you could just flip in that binder to Exhibit 301, and identify that exhibit?
A. It's the "Final Order Regarding April 2023 Forecast Supply."
Q. And can you just provide a brief explanation as to what your role was in creating Exhibits 300 and Exhibit 301?
A. In Exhibit 300, I assisted with writing findings of fact relating to the ESPA ground water flow model and calculation of a curtailment priority date for the delivery call. And in Exhibit 301, I did the calculations of the curtailment priority date and the proportionate shares for A & B and IGWA. And I inserted that information in the draft of the order.
Q. Okay. And so if I understand you correctly, once the Director determined that there was shortage to Twin Falls Canal Company, you determined that December 31st, 1953 would be the appropriate curtailment date; is that correct?
A. That's correct.
Q. And the expectation was if water users junior to the December 31st, 1953 were curtailed, you would expect approximately 75,000 acre-feet of water would

accrue to Twin Falls Canal Company; is that correct?

A. We would predict with the model that approximately 75,000 acre-feet would accrue to the near Blackfoot to Minidoka reach between May 1 and September 30th of this irrigation season.

Q. Okay. And Twin Falls Canal Company's water supply is supplied by that reach of the river; is that true?

A. Yes, they have a natural flow that is diverted from that reach of the river.

Q. Okay. And in determining the curtailment date, and the amount of water that would accrue to the Twin Falls Canal Company, you used the model in a transient mode; is that true?

A. Yes, I did a transient simulation as described in the Fifth Methodology Order.

Q. Okay. And if you could look at Exhibit 300 on page 2. And do you see the paragraph there that says that the Department has had additional, and many years to understand the impact of applying steady state modeling? Do you see that paragraph there?

A. Yes.

Q. And you didn't write this paragraph; did you?

A. No, I didn't write it. I think I was asked to look at it, and I edited a couple words in one of the

sentences just to make it technically correct.

Q. Okay. When you first started with the Department roughly 13 years ago, you knew the difference in impacts when you started with the Department between the output from a steady state model and a transient state model; is that correct?

A. Yes.

Q. And your predecessor Allan Wylie also knew the difference in model output between a steady state output and a transient model output; correct?

A. Yes.

Q. And changing from a steady state model to a transient model to predict curtailment date, wasn't a decision in the Fifth Methodology Order, Exhibit 300, based on technical information; was it?

A. Well, I was asked to prepare technical information about the change from steady state to transient, and I did present that technical information to the technical working group and the Director.

Q. I guess my question is, the change from going from a steady state model that had happened for the prior at least 13 years since you've been with the Department, to this year to the move to a transient model, the impetus for that was not a technical decision; correct?

A. It was the Director's decision. I do not know what the impetus was.
Q. Do you believe that it was a technical decision?
A. I don't know.
Q. Do you recall the deposition that I took of you a couple of weeks ago, Jennifer?
A. Yes.
Q. And in that deposition I asked what the impetus was for changing from a steady state model to a transient model in 2023. Do you recall that?
A. Not specifically.
Q. Okay. Well, we'll come back to that in a minute. Were you told why the administrative decision to change from a steady state model to a transient model was implemented in 2023?
A. My understanding is that it is because of direction that the -- direction from the court that the water needs to be provided during the irrigation season at the time and place that it's needed.
Q. And who told you that it was the court that directed that change?
A. I believe Gary Spackman said that.
Q. When we first were at the Department, you understood that the ESPAM model was a transient model;

is that true?

A. The ESPAM model can run simulations in steady state or in transient.

Q. Okay. And the ESPAM model has always been able to run a transient output; correct?

A. Yes, previous versions of ESPAM could also run a transient simulation.

Q. And the current version of the ESPAM model, do you recall when it was implemented or created?

A. I'm sorry. Can you repeat the question?

Q. Yep. The current version of the ESPAM model it's -- maybe I'll do it this way, is 2.2; is that true?

A. Yes.

Q. And ESPAM2.2 when did it first exist?

A. It was finalized in May of 2021.

Q. The current version of ESPAM2 is finalized in May of 2021. And the prior version was ESPAM2.1; correct?

A. Yes.

Q. And when was ESPAM2.1 finalized?

A. It was either the end of 2012 or early in 2013.

Q. Okay. So roughly in 2013 when ESPAM2.1 was updated from the prior version, it was calibrated using monthly stress periods in half-month time steps; is that

true?
A. Yes.
Q. And the current version of ESPAM2.2 also uses monthly stress periods in half-month time steps; correct?
A. Yes.
Q. So prior to 2023, the model was capable of predicting an in-season amount of water that could be expected in the near Blackfoot to Minidoka reach; is that true?
A. Yes.
Q. Because the current version has been able to do that since roughly 2013; correct?
A. Well, I wouldn't say the current version, but the previous version, 2.1 could, yes.
Q. Okay. But there is nothing that changed between 2.1 and the 2.2 version that makes the monthly stress period and the half-month time step different from a transient model standpoint?
A. The time discretization did not change between ESPAM Version 2.1 and ESPAM Version 2.2.
Q. So effectively ESPAM2.2 has always been a transient model?
A. I'm sorry. Repeat that?
Q. So ESPAM 2 and 2.1 -- we'll just say it this

way. So ESPAM2.1 and ESPAM2.2 has always been a transient model; correct?

A. They were both calibrated as transient models, yes.

Q. Okay. In 2023, you understood the difference between the model output for transient versus steady state output; correct?

A. Yes.

Q. And you also understood in 2013, ten years prior, the difference between the model output for transient versus steady state output; correct?

A. Yes.

Q. And since 2013, there were curtailment orders in the surface water delivery call; correct?

A. Yes.

Q. Yet they all used the steady state output; isn't that true?

A. Yes, a steady state simulation was used.

Q. Okay. Even though ESPAM2.1 starting in 2013 through 2021 had the monthly stress periods and half-month time steps capable of being ran in the transient mode?

A. Yes.

(Exhibit 318 marked.)

Q. (BY MS. McHUGH) Could I have you look at

Exhibit 318. Jennifer, can you identify this exhibit?
A. It's a presentation titled "Surface Water Coalition Methodology - calculation of priority dates for curtailment of ground water users."
Q. Is it a PowerPoint presentation that you prepared?
A. Yes.
Q. And the date being November 28, 2022?
A. Yes.
Q. And did you provide this PowerPoint presentation to the Surface Water Coalition technical working group?
A. Yes.
Q. Jennifer, is the exhibit in front of you, does it have page numbers on it or slide numbers?
A. No.
Q. Okay. And so for ease of examination, I'm going to have you like have to thumb through, and I will say like Slide 6, which would essentially be the sixth page of that exhibit. Does that make sense?
A. Yes.
Q. Okay. And if you would just look at that Exhibit 318, is it complete? Is it completely your PowerPoint presentation, are all the slides in that?
A. I don't know. I don't have every page

memorized, so I wouldn't be able to just be able to look at it and know what was missing.

Q. Fair enough. Okay. Can you tell me how many pages it is, just so I'm making sure we have the same exhibit?

A. I have 22 pages.

Q. Okay. And mine has 22 pages, so we're good. Okay. Before we get into the actual pages there, just a little bit of background. Are you aware that there has been a moratorium on new wells without mitigation, so new wells on the Eastern Snake Plain Aquifer since the early 1990s?

A. Yes.

Q. So almost all the wells that withdraw water from the Eastern Snake Plain Aquifer have been pumping for at least 30 years, and some much longer than that; correct?

A. I believe that's correct, yes.

Q. Okay. And if you could look at Slide No. 6 of your Exhibit 318. And Slide No. 6 is a graph that talks about, that shows the steady state conditions. Is that what you see there?

A. It's the time to reach the steady state response.

Q. Okay. And isn't it true that between 90

percent and 99 percent of the impacts of all ESPA pumping on the Snake River flows have been realized?

A. Yes.

Q. And that's what this Slide No. 6 of Exhibit 318 shows that; correct?

A. Yes, it states that in the bullet.

MS. McHUGH: Okay. At this point, I guess I would offer Exhibit 318 as an exhibit, or an offer into the record.

THE HEARING OFFICER: Any objections?

Hearing none, the document marked as Exhibit 318 is received into evidence.

(Exhibit 318 received into evidence.)

Q. (BY MS. McHUGH) Jennifer, continuing on with Exhibit 318, if you could look at Slide No. 13.

THE HEARING OFFICER: Ms. McHugh, it might be helpful rather than just giving us numbers, if somehow we cam identify a title on the page, since the pages are not numbered.

MS. McHUGH: Yes, fair enough.

Q. (BY MS. McHUGH) So on Slide 13, can you read the title of that page?

A. "Comparison of priority dates calculated for April demand shortfall forecasts for May 1 curtailment."

Q. And if you recall, and if you need to look

back at Exhibit 301, which is the 2023 As-Applied Order. Do you recall the amount of water that was forecasted to be short in the 2022 season?

A. Yes.

Q. And that number is roughly 75,000 acre-feet; is that right?

A. Yeah, 75,200 acre-feet.

Q. Okay. And if you look at page No. 13, it says, "Comparison of priority dates calculated." If you look at that graph, based on this slide, curtailment of wells junior to sometime in the mid-1980s would produce roughly 75,200 acre-feet to the near Blackfoot to Minidoka reach of the Snake River in steady state; is that right?

A. Can you --

Q. If you look at the yellow line?

A. So, yeah, if you are looking at the yellow line, a steady state curtailment, which would be a continuous curtailment to the same date every year with a priority date in the mid-1980s would produce approximately 75,000 acre-feet.

Q. So in other words, would you agree that if wells junior to the mid-1980s had never started pumping, there would be an additional 75,200 acre-feet in the river in 2023?

A. Assuming all other aquifer and recharge and discharge occurred the same over those years, then, yes, there should be approximately that additional volume in the reach, in the river reach.

Q. And as a result, without the pumping of those wells junior to the mid-1980s, there would be no forecast shortage for the Surface Water Coalition members in 2023; correct?

A. Yes.

Q. Okay. I'm just going to switch gears for a brief moment. In roughly August of 2022, the Director notified the parties that he was convening a technical working group regarding the Surface Water Coalition delivery call; is that your understanding?

A. Yes.

Q. And how were you notified or told that there was going to be this technical working group?

A. I was told by Matt Anders.

Q. Okay. And did you know which people were told or asked to, or invited to be part of the technical working group?

A. No.

Q. Who made the decision on who would be invited to participate in the technical working group?

A. I don't know.

Q. And when did you first become aware of who was invited to participate in the technical working group?

A. I don't know that I was ever aware of who was invited. My only knowledge is of who was in attendance when I gave the presentation. And I doubt that I even recall who all was in attendance. But I am aware of some of the attendees.

Q. Okay. And when you gave your presentation, which I think you are referring to Exhibit 318, the PowerPoint. Did you do that via Zoom, or some other remote meeting format?

A. I gave the presentation from our conference rooms. But there were some attendees in person and some that were participating remotely.

Q. Okay. And then did you provide the PowerPoint presentation to the technical working group via the Department's website; is that how people got the information?

A. I presented it in the meeting, and I believe -- and I gave a PDF version to Matt Anders, that I believe he sent out to the technical working group. But I did not personally send it out.

Q. Okay. Coming back to Slide 13 in Exhibit 318. This year the Director predicted that approximately 75,200 acre-feet of shortfall was going to Twin Falls

Canal Company. If you look at your graph there on Slide 13 of Exhibit 318, it shows the difference in the number of acres that would be curtailed using a transient model versus a steady state model; correct?

A. Yes, you can determine that information by comparing the different points on this graph.

Q. Okay. And then I think in your presentation you also -- well, let's just stick with this slide first. If you look at the graph there, it shows that in order to get 75,000 acre-feet to Twin Falls Canal Company using a steady state model, the number of acres that would be curtailed is approximately 75,000 acres. Do you see that, or would you agree with that?

A. If you curtailed to the mid-1980s, the acres curtailed would be somewhere in that ballpark, yes.

Q. Okay. And that would show roughly 75,000 acre-feet to the near Blackfoot to Minidoka reach; correct?

A. Well, it would show that that would get there -- that that would be the long-term annual average if that curtailment occurred continuously every year.

Q. Okay. And if you also look at that graph, in order to get 75,000 acre-feet of water to Twin Falls Canal Company during this season in a transient state model, it would require the curtailment of approximately

700,000 acres; is that correct?
A. That's correct.
Q. So nearly ten times as many acres; correct?
A. Roughly, yes.
Q. Okay. Were there any discussions on whether that was a reasonable outcome?
A. I think that was discussed, yes.
Q. And was it discussed with you?
A. To some extent, yes.
Q. And the conclusion was what?
A. The conclusion I think is evident in the Director's order was that the conclusion was that the requirement is to get the water to the reach during this irrigation season and that that was the deciding factor.
Q. Okay. So you agree that in order to get 75,000 acre-feet of water to Twin Falls Canal Company during this irrigation season needing to curtail 700,000 acres is a reasonable outcome?
THE HEARING OFFICER: Okay. Ms. McHugh, I will insert and just state that this line of questioning is not one that Ms. Sukow is qualified to answer.
And I'll instruct the witness not to answer the question. That was not her assignment in developing the data and producing the report that she produced.
MS. McHUGH: Okay.

(Exhibit 305 marked.)

Q. (BY MS. McHUGH) Ms. Sukow, could I have you look at Exhibit 305. And can you identify Exhibit 305 for the record?

A. "Final Order Regarding April 2022 Forecast Supply."

Q. And did you assist the Director in preparing any portion of the April '22 forecast supply?

A. I calculated a curtailment priority date using the ESPA ground water flow model, and I calculated, I believe in this one, yes, a proportionate share for A & B Irrigation District.

Q. Okay. And if I'm correct, the Director predicted that Twin Falls Canal Company would be short approximately 162,000 acre-feet in that order; is that correct?

A. It says 162,600 acre-feet.

Q. Okay. And if you look at Exhibit 318, back to Slide No. 13. How many acres would be curtailed in a steady state model run to supply 162,000 acre-feet of shortage?

A. It's somewhere around 150,000 to 170,000 acres perhaps.

Q. Okay. And if you were to run that same number with transient model output, how many acres would be

curtailed, approximately?

A. Approximately 940,000 acres.

Q. Okay. And if you could turn to Slide No. 15. If I'm looking at Slide No. 15 -- do you have that there?

A. Yes.

Q. And could you give me the title of that slide?

A. "Predicted response to May 1 curtailment of water rights junior to October 11, 1900."

Q. And this slide shows that if you curtailed back to a 1900 priority date, the April to September accrual to the reach that supplies Twin Falls Canal Company would be approximately 97,700 acre-feet; is that correct?

A. Yes.

Q. Isn't it true that if you curtail all the ground water users starting May 1st of any given year, that the maximum amount of water that accrued that season would be 97,700 acre-feet to that reach?

A. That is the predicted volume to accrue from curtailing all of the ground water users junior to October 11th, 1900 within the area of common ground water supply.

MS. McHUGH: Okay. I don't have any further questions. Thank you, Jennifer.

THE HEARING OFFICER: Okay. Thank you, Ms. McHugh.

MS. McHUGH: I would just ask that Exhibits 300, 301, and 305 be admitted. I realize they are the Director's orders in this case, and then the order from last year. But I think for ease of examining it is helpful to have them in as exhibits.

THE HEARING OFFICER: Any objection to the admission of the documents marked as Exhibit 301, 302, and 305?

MR. FLETCHER: No objections.

THE HEARING OFFICER: Hearing no objections, documents numbered 301, 302, 305 are received into evidence.

MR. BRICKER: I just want to clarify.

THE HEARING OFFICER: Yes.

MR. BRICKER: Was it 300 to 301, or 301 and 302?

THE HEARING OFFICER: I'm sorry. I'm assuming that it's 300, 301 --

MS. McHUGH: 300, 301, and 305.

THE HEARING OFFICER: And 305. And I misstated. Thank you.

(Exhibits 300, 301, 305 received into evidence.)

THE HEARING OFFICER: Okay. Anything further, Ms. McHugh?

MS. McHUGH: Nothing further. Thank you.

THE HEARING OFFICER: Okay. Thank you.

It's 10:30. We've been engaged for an hour-and-a-half. Do you the parties want a break, should we continue with another set of questions? Anybody?

Let's forge ahead. Who's next.

MS. KLAHN: I have a couple of questions. I was trying to send then to Candice, but it didn't work.

THE HEARING OFFICER: Ms. Klahn.

CROSS-EXAMINATION

QUESTIONS BY MS. KLAHN:

Q. Good morning, Jennifer. My name is Sarah Klahn. I represent the City of Pocatello. I wanted to ask you about some things related to the modeling questions that Candice was asking you. And I want to back up a step and ask you a little bit about model calibration. Is that something you are involved with?

A. Yes.

Q. Okay. In the framework of model calibration, is one of the inputs you use to compile the return flows associated with Twin Falls Canal Company?

A. Indirectly they are used to calculate. Their

return flows are used in the calculation of the Kimberly to King Hill reach gain, which is used in the calibration.

Q. Okay. And is that because the calibration involves understanding reach gains that come from ESPA discharges versus reach gains that accrue from return flows from the south side, where Twin Falls is located?

A. Yes.

Q. Okay. So when you are compiling these, you would subtract them from the reach gains coming from the north side in order to get the correct relationship; is that true?

A. No, that's not correct.

Q. Okay. Can you tell me what is correct?

A. So the reach gain from the north side the target for that is calculated by taking the inflow gage at Kimberly, the outflow -- and so the river flow at Kimberly, the river flow at King Hill going out of that reach. And then adding or deducting adjustments for all of the other surface flows that occur in between there, and the inflow from the south side.

Q. Okay.

A. So it's not an adjustment to the ESPA discharge. The ESPA discharge is the reach gain. It's just used to calculate how much of what's in the river

in that reach, you know, there is other components in the river flows at that reach. So we have to adjust to them, adjust those out to know what our target is for the ESPA discharge.

Q. Okay. Thank you for that explanation. Can you confirm that the total amount of return flows associated with Twin Falls Canal Company that you're using in that manipulation you just described, is between about 300,000 and 400,000 during the irrigation season?

A. I don't recall. I would have to look at my spreadsheet to -- I don't have that number, that volume memorized.

Q. Have you evaluated any long-term trends in Twin Falls return flows as part of your calibration efforts for the model?

A. Oh, we don't need to do that for the model, because we're looking at the past. So we just look at the measured data that occurred and subtract that off when we're calculating the reach gain.

Q. But in the spreadsheet you are describing, it would include sources of water from the Twin Falls system that are contributing the return flows?

A. Well, it includes the measurements made at the locations where those returns occur.

Q. Is seasonality any part of the evaluation that you do when you are doing that?

A. Well, we use monthly data, so the seasonality is inherent in those monthly averages.

MS. KLAHN: Okay. Thank you. That's all I have.

THE HEARING OFFICER: Okay. Further questions? I thought I saw a hand up.

Mr. Budge.

CROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Thank you, Ms. Sukow. I'm TJ Budge, on behalf of the Idaho Ground Water Appropriators. I will try not to duplicate the questions you got from Ms. McHugh.

Jennifer, you are the lead ground water modeler with the Department?

A. That's not officially my title, but...

Q. Did you provide all of the modeling work that was utilized in the Fifth Methodology Order?

A. I provided the modeling work that was presented to the technical working group and the Director that was used I think as a basis for that, yes.

Q. Was there other modeling work that was created in the Department that you did not provide to the technical working group?

A. No.
Q. Okay. And if the Director wanted to know any modeling issues related to the Fifth Methodology Order, you're the one who would have produced that information?
A. To my knowledge, yes.
Q. Okay. In terms of the initiation of the review of the Fourth Methodology Order, that decision came from the Director; correct?
A. I'm sorry. Repeat the question.
Q. The decision to review the Fourth Methodology Order, that came from the Director?
A. That's my understanding.
Q. You didn't tell the Director that there had been some change in the modeling data that necessitated a change to the methodology order?
A. No.
Q. And the modeling work that you did on the Fourth Methodology Order, that came at the direction of the Director or Matt Anders?
A. I was directed by Matt Anders to do that, yes.
Q. Okay. So if Matt told you to do some type of modeling, then you performed that at his direction?
A. Yes, and he was the one who communicated to me what the Director wanted me to model.
Q. Understood. And if Matt told you not to do

some type of modeling, then you would not have done that?

A. He told me what modeling -- or told me what questions they wanted to address, and I did the modeling. I wasn't directed not to do any modeling.

Q. Got you. You did not go outside the scope of the instructions that Matt had given you?

A. No.

(Exhibit 914 marked.)

Q. (BY MR. BUDGE) Okay. If you could turn to Exhibit 914.

THE HEARING OFFICER: We should have two common exhibit binders. 914, Mr. Budge?

MR. BUDGE: Yes.

Q. (BY MR. BUDGE) Jennifer, do you recognize that document?

A. Yes.

Q. Could you read the title for the record?

A. "Comments on behalf" -- oh, I might be on -- what did you say?

Q. 914.

A. Okay. Never mind. "Comments on Behalf of the Coalition of Cities and the City of Pocatello on the Idaho Department of Resources Summary of Recommended Technical Revisions to the Fourth Amended Final Order

Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition," by Kara Ferguson and Matt Anders, on December 23, 2022.

MR. BUDGE: Okay. Director, could we go off the record for a moment?

THE HEARING OFFICER: Yes.

(Off the record.)

MR. BUDGE: Back on the record.

Q. (BY MR. BUDGE) Jennifer, before we went off the record, you had read the title of what I think is Exhibit 915; is that correct?

A. That's correct.

Q. Why don't you go ahead and read the title of 914?

A. "Summary of Recommended Technical Revisions to the Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition."

Q. Do you recognize that document?

A. Yes.

Q. Is this a document the Department staff prepared in connection with its work on the Fifth Methodology Order?

A. It was prepared by Kara Ferguson and Matt Anders.
Q. And you did not participate in drafting that document?
A. I did not draft or edit the document.
Q. Okay. If you could turn to Exhibit 318? Jennifer, this is the presentation that you gave to the technical working group; is that right?
A. That's correct.
Q. And my understanding is that this presentation, along with the underlying data that was posted to the Department's website, that consists of all of the modeling work you did related to development of the Fifth Methodology Order?
A. Yes.
Q. Okay. You didn't do any modeling work after that presentation was given, but prior to the issuance of the Fifth Methodology Order?
A. Not for this issue, no.
Q. What issues did you do modeling work?
A. Well, I'm doing modeling work all the time. That was a pretty vague question.
Q. Not related to the Fifth Methodology Order?
A. Not related to the Fifth Methodology Order.
Q. Thank you, I appreciate that. I'm going to

shift gears just briefly.

During your deposition we discussed an irrigated lands dataset that's used in the ESPA model; correct?

A. Yes, I believe we did.

Q. And can you explain what that dataset consists of?

A. The irrigated lands datasets that we're currently using in model calibration are developed by IDWR's GIS staff. And they delineate what -- they delineate lands as being either irrigated, or semi-irrigated or non-irrigated by using a variety of data sources.

Q. What are the data sources they utilize to make those designations?

A. Some of the data sources are the CDL common land unit polygons. They use Landsat photography. They use aerial photography. They use, I should say, Landsat images. I believe they sometimes refer to the metric ET images. I don't do that work myself. So there may be other data sources that I'm not aware of that they look at.

Q. Okay. And that dataset identifies for each irrigated field, whether it's ground water irrigated or whether it's irrigated or non-irrigated?

A. Yes, they have three classifications; irrigated, non-irrigated, or semi-irrigated, which means part of it might be irrigated and part of it not. There are areas where typically there are developed areas. You might have a subdivision with houses and lawns and roads. And it's too time consuming an effort to delineate each of those little polygons. So they lump them altogether.

Q. How is this dataset used in the aquifer model?

A. It is used to calculate aquifer recharge and discharge in conjunction with ET data and precipitation data. So it's used to calculate the irrigation demand.

Q. Could that dataset be used within a particular geographic area just to identify the total number of irrigated acres?

A. Yes.

Q. And is that the best dataset available for use in the model for the purpose for which it's used?

A. That is the best dataset we have for model calibration, yes.

Q. Okay. Let me ask you about another component of the model that we discussed during your deposition, which you referred to as the ground water fraction. Could you describe what that term means?

A. So the ground water source fraction is so

some -- you know, some of the irrigated lands have only surface water supply. Some have only ground water supply. But some have both, and we call that mixed source. And within that mixed source, we need to estimate what fraction of that is supplied by surface water, and what fraction is supplied by ground water.

Q. And how is that dataset created?

A. The original dataset and the -- I guess I should clarify that dataset also includes zeros and ones for things that are entirely supplied by surface water ask ground water. That dataset was initially produced by IWRRI for a previous version of ESPAM. So I don't have direct knowledge of how they produced it.

Q. Okay. And how is that dataset used in ESPAM?

A. It is used to -- the irrigation demand that we calculate from the irrigated lands ET and precipitation, it is used to assign that to either surface water diversions or ground water pumping. So it's used to estimate, you know, which source of supply provides that.

Q. Okay. And is that the best dataset available to you for use in the model for distinguishing between land that's irrigated with surface water, ground water, or a combination?

A. It is the best dataset we have, yeah.

Q. Okay. I want to just ask a few follow-up questions about the change from a steady state to transient state application of the model in this case just to make sure I understand.

The model was capable of being used in a transient state at the time the Fourth Methodology Order was issued?

A. Yes.

Q. Could the model also be run at a transient state when the Third Methodology Order was issued?

A. Yes.

Q. How about the Second Methodology Order?

A. I think you may be getting beyond what -- I don't know the dates of those orders. If there was a version of ESPAM available at those dates, then it was capable of running the transient simulation.

Q. Okay. So if ESPAM was utilized, then it was capable of being run in a transient state?

A. Yes.

Q. Okay. So the Director's decision to change from a steady state to transient state was not based on a change in model capabilities; correct?

A. The model capabilities with respect to being able to run a transient simulation did not change.

Q. Okay. So it would have been a policy decision

of the Director?

A. Yes.

Q. Let me just ask a few questions about the presentation you gave to the technical working group. I believe you have that in front of you. It's Exhibit 318. If you'll please turn to page 20 of that exhibit. And this slide is labeled "Comparison of priority dates calculated using transient and steady state analyses." Do you have the that in front of you, Jennifer?

A. Yes.

Q. As I understand this slide, it provides a comparison of the number of acres that would be curtailed under a steady state application of the model versus a transient state application of the model under different curtailment scenarios?

A. Yes.

Q. And this data was prepared to show those who participated in the technical working group, that a transient state application results in exponentially more acres being curtailed in response to a predicted demand shortfall than under a steady state; is that correct?

A. It is approximately one order of magnitude, yes.

Q. Okay. Let me have you go back to page 15 of

that exhibit. This slide is titled "Predicted response to May 1 curtailment of water rights junior to October 11, 1900." Yes?

A. Okay. Just to clarify, because there is two in a row that have that title. Is it the bar chart or the line graph?

Q. The line graph.

A. Okay.

Q. And thank you for that clarification. I appreciate that.

Ms. McHugh may have asked you this, so I don't mean to be repetitious. But can you explain why the date October 11th, 1900 is selected?

A. I asked Matt Anders what the, you know, controlling priority date was. And my understanding from him is that Twin Falls Canal Company and North Side Canal Company have natural flow rights to the Snake River with that priority date. So any ground -- you know, there is some small amount of ground water use that is senior to that. And, obviously, they weren't included in the curtailment scenarios, because they are senior to the delivery call water right.

Q. The number of ground water rights senior to that 1900 date is very, very small; is that right?

A. It's pretty small.

Q. Generally speaking, a 1900 curtailment date will result in curtailment of every ground water right from the Eastern Snake Plain Aquifer?

A. Well, again, like I said, there are some that are senior, and there are some that are outside the area of common ground water supply, which would not be subject to administration and so -- but it would be -- it would be a very large percentage of -- yes.

Q. And you've got a slide. I don't have the number in front of me. But a slide that shows that with an October 11th, 1900 curtailment date, there would be 941,400 curtailed acres; is that right?

A. That sounds right. What I recall is it's approximately 941,000. Yeah, 941,400.

Q. Okay. So just to connect the dots. Your transient modeling shows that anytime there is a predicted demand shortfall of 97,700 acre-feet or more, in the absence of mitigation, you would have curtailment of 941,400 acres?

A. Approximately, yes.

Q. Okay. Let me have you flip forward again to page 20. We reviewed this a moment ago. But on the right side of the table, it compares the number of acres that would be curtailed under the transient state application of the model versus a steady state. These

are aquifer wide figures, or maybe to be more precise, this is the area within -- this is within the area of common ground water supply?

A. Yes.

Q. Did you analyze what the transient state reach gains would be from curtailment ground water district by ground water district before the Fifth Methodology Order was issued?

A. Not for this, not in connection with the Fifth Methodology Order.

Q. Had you done that in connection with other modeling work?

A. And I can't recall exactly what I did. But I was asked to do some modeling in support of the settlement discussions between the parties. And I recall I was asked to do something by ground water district. And I don't recall exactly what I did, or how it would or would not fit in with what you just asked in your question. But it was not for this proceeding.

Q. Okay. Were you aware prior to when the Fifth Methodology Order was issued, were you aware of the different transient state impacts by ground water district on the near Blackfoot to Minidoka reach?

A. I mean, yes, I'm aware of different impacts from different locations in the aquifer, certainly.

(Exhibit 197 marked.)

Q. (BY MR. BUDGE) Let me have you turn to Exhibit 197. Jennifer, do you recognize this document? It's labeled "Attachment 1, IGWA Proportionate Share Modeling, May 2023 Curtailment"?

A. I believe I did see this in one of the expert reports that was submitted.

Q. This was a document prepared by Jaxon Higgs. And I just want to ask if you are familiar with any of the data that's in here. And maybe what I'll do is I'll just note in the column labeled "IDWR Portion of April 2023 Predicted Demand Shortfall," there is actually two columns there. There is an acre-foot column and a percentage column. And if you go to the bottom of the acre-foot column, you'll see the figure 63,645 acre-feet. Do you see that figure?

A. Yes.

Q. You understand that that represents IGWA's proportionate share of the total predicted demand shortfall of 75,200 acre-feet?

A. Yes.

Q. And then if you go to the next block of columns on the right, kind of in the middle of the spreadsheet. There is a column that says, "Transient May to September Impact." And that's showing the May to

September reach gains from near Blackfoot to Minidoka reach from curtailment in each of those districts. Do you see that column?

A. I see that column.

Q. Are you familiar with the data that's shown in that column that shows the reach gains attributable to curtailment within each ground water district?

A. I did not develop that, those columns. That analysis I believe was done by Jaxon.

Q. Is this an analysis that you've done independently for other purposes, or it's just part of your general modeling work for the Department?

A. I have not done that analysis for -- I did not do that analysis for this priority date, no.

Q. Okay. Have you done that for other curtailment dates?

A. I don't think I did it for any curtailment dates, no.

Q. Have you done that analysis in any other context?

A. Again, I did some sort of analysis by ground water district for the discussions in the settlement talks. And I don't recall exactly what I did. I did not review that in preparation for this hearing.

Q. Okay. So I understand this is Jaxon's

analysis. But if you look at that column, maybe we'll go to the bottom line for North Snake Ground Water District. It shows that curtailment of every water right junior to 1900 in North Snake Ground Water District would curtail 217,000 acre-feet. And the transient benefit to near Blackfoot to Minidoka reach from May to September would be 0.06 acre-feet.

Were you generally familiar, or did you understand prior to when the Fifth Methodology Order was issued, that curtailment of water rights in North Snake Ground Water District would provide essentially no reach gains to the Coalition?

A. During this irrigation season, I didn't do the analysis. But, yes, you would expect that.

Q. Okay. So Jaxon's figures are consistent with your general understanding of the transient impacts by ground water district?

A. Yes, they are consistent with my general understanding. Yes.

Q. Thank you. During your work related to development of the Fifth Methodology Order, did you ever inform Matt Anders or the Director that curtailment in places like North Snake, Henry's Fork, Madison are likely or at least predicted to provide little if any benefit to the Coalition?

A. Well, they will provide benefits in future years in years of -- so they do provide long-term benefits. And they do have long-term impacts on the water in the river reach. So if you don't include them, then you are putting the -- you are basically shifting the responsibility for the shortfall to those users that are closest to the reach, and have the most immediate impact, even though the impacts have been caused by decades of pumping of people that are also further away. So we did have some discussion about that at some point.

Q. Okay. And as part of that discussion, did you explain that there wouldn't be any benefit in terms of mitigating the predicted demand shortfall for 2023?

A. I don't recall whether or not we specifically discussed that.

Q. Okay. So to your knowledge was information provided to the Director before he issued the Fifth Methodology Order that would have made him aware that curtailment in North Snake Ground Water District, Carey Valley Ground Water District, Henry's Fork Ground Water District, and Madison Ground Water District would provide no reach gain benefits to the Coalition in 2023?

A. I was not asked to provide any analysis by ground water districts for the Fifth Methodology Order. So, no, he would not have had that specific information

by ground water district.

Q. Okay. Aside from that information being specific to a ground water district, did you advise the Director that just generally speaking curtailment in these further away locations would not provide any benefit to the Coalition in 2023?

A. I don't recall.

Q. To your knowledge the Director did not have the benefit of this type of information before him when he issued the Fifth Methodology Order?

A. I don't know.

(Exhibit 929 marked.)

Q. (BY MR. BUDGE) Okay. Let me have you turn next to the Exhibit 929. Jennifer, this is a copy of IDAPA 37.03.11, the Rules for Conjunctive Management of Surface and Ground Water Resources. Do you have that in front of you?

A. Yes.

Q. We refer to these generally as the Conjunctive Management Rules. Are you familiar with these rules?

A. To some extent.

Q. I'm just going to draw your attention to page 4 -- excuse me -- page 5. Do you see Rule 20.03?

A. Yes.

Q. If you can just take a moment to read Rules

20.03 and 20.04. And let me know if you are familiar with these rules?

A. (Witness complying.) I'm familiar with them to the extent that I'm aware they exist.

Q. Okay. I'll draw your attention to the last sentence in Rule 20.03, and I'll read that. It says, "An appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water as described in this rule."

Were you asked to do any ground water modeling related to the disparity and -- let me strike that question.

Did this rule ever come up in your discussions with Matt Anders or other Department staff relative to the development of the Fifth Methodology Order?

A. I did not discuss those types of legal aspects with them, no.

Q. Okay. And Rule 20.04 refers to the futile call doctrine. Did that ever come up in your discussions with Matt Anders or other Department staff relative to the development of the Fifth Methodology Order?

A. Not that I recall, no.

Q. So you performed no analysis of the magnitude of curtailment compared to the predicted benefit to the Surface Water Coalition?

A. Well, I did present the magnitude of curtailment compared to the benefit of curtailment. That data are in Exhibit 318.

Q. Okay. Aside from page 20 of Exhibit 318, you didn't do any other analysis that compares the magnitude of curtailment to the predicted benefit to the Coalition?

A. No.

Q. Are you familiar with the concept of a trimline that has been used in delivery calls?

A. Yes.

Q. Can you explain what you understand that term to mean?

A. My understanding is it's an area designation that identifies -- it identifies an area beyond which the impacts of pumping are de minimis to the reach of interest.

Q. Okay. Did the concept of a trimline ever come up in your work related to the Fifth Methodology Order?

A. Again, I don't recall discussing a trimline with respect to this proceeding.

Q. So you didn't ask Matt Anders or the Director

if that's something you should look into?
A. Not that I recall.
Q. And neither of them instructed you not to evaluate trimlines?
A. No, I don't recall receiving any instruction about trimlines.
Q. Okay. Let me next have you turn to Exhibit 301. This is what we called an As-Applied Order of the April 2023 As-Applied Order. I believe Ms. McHugh asked you some questions about this document. This is something you are familiar with, Ms. Sukow?
A. Yes.
Q. If you'll flip to page 5. At the bottom of page 5 there is a footnote, Footnote 5. And it identifies the proportionate mitigation obligation of IGWA as 63,645 acre-feet. Is that a calculation that you made using the model?
A. Yes.
Q. As you know IGWA is made up of several ground water districts. Before the Fourth Methodology Order was issued, had you calculated each individual ground water districts proportionate share of that 63,645 acre-foot figure?
A. I don't refer to it as a proportionate share, because they did not -- they didn't have mitigation

plans. But our attorney, Garrick Baxter, asked me to calculate the percentage of IGWA's proportionate share that could be assigned to each ground water district, I believe, in a response to a request that was made by yourself or one of the other attorneys.

Q. Yes. Thank you.

(Exhibit 126 marked.)

Q. (BY MR. BUDGE) If you could turn to Exhibit 126.

A. I don't have that one.

MR. FLETCHER: 126?

MR. BUDGE: Yes, 126.

Q. (BY MR. BUDGE) Jennifer, what I have in front of me is Exhibit 126 is an email from Garrick Baxter to myself and others. And the subject line says, "Request to delineate proportionate shares of mitigation obligation." Do you see that?

A. Sorry. Say that again.

Q. The Exhibit 126 that I have up is an email from Garrick Baxter to myself and others --

A. Yes.

Q. -- is that what you see?

A. Yes. Yes.

Q. Okay. In that email there is a table that shows the ground water districts, and their

proportionate percentages in acre-feet with respect to the 63,645 acre-foot mitigation obligation of IGWA. Do you see that table?

A. Yes.

Q. Did you generate the data that's shown in this table?

A. Yes.

Q. Okay. And you mentioned a moment ago that you were asked by Mr. Baxter to apportion out IGWA's mitigation obligation, the 63,000 acre-feet figure among the ground water districts. Does this reflect your analysis in that regard?

A. Yes.

Q. That middle column that has acre-feet figures totaling 63,645 acre-feet. I want to ask you some questions about that. And we can continue to use North Snake Ground Water District as an example. But on that bottom row for North Snake, it shows that its portion of the 63,645 acre-feet is 3,262 acre-feet. Does this table indicate that curtailment of every water right within North Snake junior to December 30th, 1953, that would produce a transient state reach gain to the Surface Water Coalition of 3,262 acre-feet?

A. No, it does not.

Q. What does this column represent then?

A. So this is not -- this column is not looking at the benefit of curtailment. This column is looking at what their share of the demand shortfall is if they are going to mitigate by providing storage water. And the shortfall is the result -- this year's shortfall is the result of decades of pumping. So if they are going to mitigate by providing storage water, then their share of the demand shortfall is based on their long-term impact.

Q. Okay.

A. Not what will happen as a result of curtailing starting this May.

Q. Okay. And the demand shortfall predicted in the As-Applied Order that's a predicted demand shortfall for the 2023 irrigation season; correct?

A. Yes.

Q. And under this approach to allocating that predicted demand shortfall. Some ground water districts such as North Snake would have to provide more water as mitigation than the Coalition would receive from curtailment. And other ground water districts would have to provide less water as mitigation than the Coalition would receive from curtailment?

A. I don't think that's true as far as the Department's concerned. IGWA's proportionate share is

63,645 acre-feet. And the Department, I don't think, has a say in how you decide to split that up. You asked us to provide a breakdown, and I did it by this method. And Garrick sent it to you as a courtesy. But we are not telling you that that's how you have to split up the proportionate share.

Q. Yeah. And I appreciate that. And I don't actually even mean to be critical of the method. It's just one method; right? It's not the only method. And I just wanted to highlight that under this method in the proportionate mitigation obligations don't match up with the transient modeled reach gains?

A. No, they do not.

MR. BUDGE: Okay. Thank you, Jennifer. I don't have any further questions.

THE HEARING OFFICER: Okay. Thank you, Mr. Budge.

Do we want to take a break?

MR. FLETCHER: Yes.

THE WITNESS: I could use a restroom break, if I'm allowed to ask.

THE HEARING OFFICER: Yes. Let's break for ten minutes. We'll be back at 11:30.

(Recess.)

THE HEARING OFFICER: Back on the record,

Colleen. All right. We are recording again.

More questions of Ms. Sukow. Mr. Harris.

CROSS-EXAMINATION

QUESTIONS BY MR. HARRIS:

Q. Ms. Sukow, I'm Rob Harris, attorney for the City of Idaho Falls. I have just some follow-up questions to some of your prior testimony.

Mr. Budge talked to you about the IDWR irrigated lands datasets. Could you just explain to me what those are again?

A. They are delineation of -- a land use delineation done by IDWR GIS staff that delineates land units --

MR. BAXTER: Sorry, Director. We're not able to hear Ms. Sukow online.

THE WITNESS: Sorry. I had my microphone off.

THE HEARING OFFICER: Okay. Are we okay? Let's try.

THE WITNESS: The irrigated lands datasets are delineations of land use by IDWR's GIS staff, where they delineate land unit boundaries, and then classify them as either irrigated, non-irrigated, or semi-irrigated.

Q. (BY MR. HARRIS) And so those are hand digitized maps of irrigated acres; correct?

A. Correct, yes.

Q. And those irrigated lands datasets are used to calibrate the ESPAM model; correct?

A. They are used in calculation of the water budget input data that's used in the calibration, yes.

Q. So the answer is, yes, they are used in your model calibration?

A. They are used in the model calibration, yes.

Q. To the best of your knowledge, is there anything else that they are used for within IDWR?

A. There probably is, but I'm not specifically aware.

Q. When you say "probably," what makes you say that?

A. I have the general impression that I am not the only one that uses them.

Q. Okay. You testified about calibrating the ground water model and minusing out return flows from the Twin Falls Canal Company return flows; is that correct?

A. I said that they are used in the calculation of the Kimberly to King Hill reach gain target.

Q. Okay. And so you used river gaging information to help with that calibration; correct? Or I should ask, do you use river gage information for that calibration of --

A. We use river gage information in the calculation of reach gains. So that's to calculate an observation, a physical observation of how much of the river flow is coming from the aquifer.

Q. And do you also do that in the near Blackfoot to Minidoka reach?

A. Yes.

Q. So could you just generally explain how you calibrate model runs to what's actually seen or measured in the Snake River from near Blackfoot to Minidoka?

A. So we have -- during the model calibration we have model input data that we use that, you know, we put aquifer recharge and discharge in. And then we try to match observations. And in model calibration, there are adjustable parameters, like aquifer transmissivity, specific yield, and some other components that are adjusted to best match observed data. So some of that observed data is aquifer head, some of it is aquifer interaction with the river. So places where the aquifer either discharges to the river or receives recharge from the river. And those observations of reach gain are used as calibration targets.

Q. So let me just to make sure I understand, let me use a hypothetical. Let's say that there is 5,000 cfs measured in the river. How do you determine how

much of that is from snow melt versus reach gains from ground water in that reach?

A. You take all of the known surface components and account for them. So you have your measured inflow on the upstream end of your reach. Your measured outflow on the downstream end of your reach. You have diversions from the reach that you account for. You have surface return flows that you account for. And also you might have tributary surface streams that you have a measurement that you account for. So you just account for all those surface inflows and outflows. And then you have a residual. And the residual is your best estimate of the contribution of ground water to that reach.

Q. I see. And in terms of the measurements that you use in that calibration, do you obtain that information from Water District 1 and its watermaster, Tony Olenichak?

A. Some of it.

Q. When you say "some of it," is there anything specifically that you recall that you would obtain from him?

A. The diversion data are obtained from the Water District 01 records.

Q. You had mentioned too, though, that you will

look at water supply from other tributary basins in your calibration. Did I understand your testimony correctly?

A. In a few cases there is a tributary stream, for example, you know, the Malad River, for example, above the springs. There is flow in that river, and we have to account for that when we calculate the reach gains. Lower Salmon Falls Creek is another example of that.

Q. But I want to focus more on the near Blackfoot to Minidoka. Do you or did you in your calculations, do you look at flows out of either Willow Creek, the Blackfoot Basin, or the Portneuf Basins in that calibration?

A. Yes, I know the Portneuf is in that calibration or that calculation. The reach gains above Minidoka are actually calculated for me by another staff member. I do have a list of all the inflows and outflows that are accounted for, but I don't have them memorized.

Q. Who is that other staff member who calculates those reach gains?

A. Ethan Geisler, Guys-ler. I'm not sure how to pronounce his last name.

Q. And he works for the Department?

A. Yes.

Q. Is he a modeler as well?
A. No.
Q. Okay. You were asked before about the model runs that were presented in your PowerPoint presentation. I don't need you to refer to it. But just a follow-up question. In any of the model runs that you did for curtailment, were any ground water rights removed from those runs?
A. I'm sorry. Could you say that question again?
Q. Yeah. In the model runs that you performed, you didn't take out like, for example, A & B Irrigation District's ground water rights in those simulations? They were all just ground water rights on the Eastern Snake Plain Aquifer within the area of common ground water supply; is that right?
A. For the simulations that were presented for the various curtailment dates?
Q. Correct.
A. Yes. So anything within the area of common ground water supply junior to those curtailment dates, yeah.
Q. Yeah. And I just want to make sure that it included all ground water rights in there for any specific reason that there were any that were left out. None were left out on these curtailment runs?

A. Yeah, I -- well, so we have -- yeah. Anything that's in our irrigation POD file, and anything that's in the municipal files.

Q. Just a couple follow-up questions. In the methodology order there is an April forecast supply methodology. And I just want to ask, did you provide any technical information on the forecasted supply that only looks at the unregulated flow at Heise?

A. I'm sorry. Say that again.

Q. Well, in the methodology order, there is a part that forecast the water supply. Are you familiar with that part of the order where it looks at the unregulated flow at the Heise gage on the Snake River.

A. No, I didn't participate in that.

Q. And that's really my question. Is you weren't asked to provide any technical information on that part of the order; were you?

A. No.

Q. But as far as the technical aspects that you were asked to participate in, did you have any discussions on those technical aspects with Mat Weaver or other Department staff?

A. I probably did. I don't have a specific recollection.

Q. Okay. When you say "you probably did," what

makes you say that?

A. I'm sure we just -- I mean, we discussed what I was going to present to the technical working group.

MR. HARRIS: Okay. I have no further questions. Thank you.

THE HEARING OFFICER: Further questions by the ground water users of Ms. Sukow?

Okay. Let's shift.

MR. ANDERSON: Director, very, very quick.

Mr. Anderson.

CROSS-EXAMINATION

QUESTIONS BY MR. ANDERSON:

Q. Jennifer, when did you first learn that the Fifth Methodology Order was going to move from steady state to transient?

A. I don't know when Gary made a final decision on it. I know when I was asked to provide information on it. And that was -- that was for the technical working group.

Q. So after the technical working group, the next time you knew that it was actually going to change to transient, was when it came out in April, or did you know before the issuance of the order that it was going to?

A. I knew when I was asked to assist with

preparing the draft order.

Q. And when was that?

A. I don't recall exactly. Not that long before it came out.

Q. A few weeks, a month?

A. I don't recall.

Q. You don't recall. But when you were asked to prepare the draft order to assist in the preparation, you knew then that it was going to move from steady state to transient?

A. Yes.

MR. ANDERSON: Okay. I don't have any further questions.

THE HEARING OFFICER: All right. Thank you.

With no further questions from the ground water users, we'll shift to the Surface Water Coalition. Mr. Simpson, you stood up. Are you the examiner?

MR. SIMPSON: An examiner, Mr. Director. So I thank you for that acknowledgment.

CROSS-EXAMINATION

QUESTIONS BY MR. SIMPSON:

Q. Good morning, Ms. Sukow. My name is John Simpson. I represent A & B Irrigation District, et al., with Mr. Thompson. I just have a couple follow-up questions for you.

If you could turn to Exhibit 318 from which you testified to before. And I believe that's your slide presentation from November. And, Jennifer, if you could just look at pages 21 and 22. I believe those are your conclusions; is that correct?

A. That's correct.

Q. Those are your conclusions from the modeling you produced as a part of that presentation in November; correct?

A. Correct.

Q. As you sit here today, are those still your conclusions that you would represent to the Hearing Officer and to the parties in terms of the modeling exercise you completed in the comparison between steady state and transient?

A. Yes.

Q. Okay. And then if you would look at page 6 of that presentation. And that's the graph that you testified to earlier regarding examination by Ms. McHugh. Do you see the paragraphs in the middle of the graph regarding the "Less than 15 percent of the steady state impacts of a single-season curtailment are realized." Do you see that language in that graph, that insert?

A. Yes.

Q. Okay. And that's your conclusion; correct?
A. Yes, that's --
Q. Yes.
A. -- data from the analyses.
Q. Right. So that would support your conclusions on page 21 and 22, that the basis for why steady state analysis is not appropriate for short-term river reach gains; is that correct?
A. Well, I think beyond that, because the steady state simulations do not simulate the short-term curtailments that are prescribed in the Surface Water Coalition methodology.
Q. Okay.
A. But the difference in volume is just the result of doing something that does simulate the short-term curtailment.
Q. Right. So if you utilize the steady state model run, you are just not going to realize the amount of water into the reach to mitigate for the identified injury in the Fifth Methodology As-Applied Order; correct?
A. Not within this irrigation season.
Q. And so then the second item is in response to questions by Ms. Klahn regarding the south side returns and the consideration of those south side flow returns.

Do you recall that testimony?

A. Yes.

Q. Okay. And those numbers identified by Ms. Klahn that you testified to, were those estimates of the ground water recharge contribution from irrigation on the North Side Canal Company system?

A. I believe she was asking me about inflows from the south side.

Q. From the south side. With respect to those south side return flows, and the numbers you've testified to, or were asked about. Were those in response to the estimations, calculations regarding the estimated ground water return flows from irrigation on the Twin Falls system; do you recall?

A. Oh, I think you said north side, and I was confused.

Q. If I did, I apologize.

A. No, they are measured flows in the return channels, which are on the south side deeply incised. And in a previous version of ESPAM, we were estimating those based on a water budget method, which is I think what you are asking about. But I determined that our measurements were giving us the same volume. And then having the actual measurements is much better for calculating the reach gain, because it accounts for the

seasonality.

Before we had been averaging it. But with the measurements, we're actually able to account for the monthly seasonality, which gave us -- allowed us to remove a fair amount of noise from our reach gain calibration target.

Q. So those south side return flows that you are discussing, were those only the Twin Falls return flows, or did those include some other tributaries to the Snake River on the south side of the river?

A. Well, there is Lower Salmon Falls Creek, which, you know, we deduct out the total flow in Lower Salmon Falls Creek. Some of that is from return flows, but we don't really care whether it's from return flows or other surface flows. We just deduct off the entire creek flow.

Q. Okay.

A. And then there is also return flows from surface return flows from the north side that we deduct off?

Q. Correct.

A. Yeah.

Q. And then Mr. Budge was asking you about a calculation that you did with respect to dividing up the IGWA's proportionate share under the Footnote 5, I

believe, of the As-Applied Order. Do you recall that testimony?

A. Yes.

Q. I'm not sure if I fully appreciated the calculation you made. But my understanding is that your method that you utilized, and this was your proposed method, acknowledged the long-term impacts of each ground water district on the Blackfoot to Minidoka reach. And then once that percentage was calculated, then it was utilized in the calculation of the responsibility of each ground water district of the total for IGWA; is that correct?

A. Well, and again, that was provided as a courtesy, and the Department is not telling them, IGWA what each ground water districts responsibility is. But it is just an apportioning of it based on their long-term impacts.

Q. Right. And with respect to your work under Exhibit 318, you weren't asked whether or not to consider, when you looked at the curtailment scenarios and transient curtailment, and the number of acres to be curtailed as you've testified here today, whether or not any of those acres were the subject of ongoing mitigation plans or stipulated agreements; were you?

A. I'm sorry. Say that again.

Q. Well, simply your work that you did for Exhibit 318, the modeling you produced in November. Didn't consider whether or not any of the ground water acres that you identified that would be subject to curtailment, were part of an existing or an approved mitigation plan?

A. No.

MR. SIMPSON: Okay. That's all the questions I have. Thank you.

THE HEARING OFFICER: Any other questions from the Surface Water Coalition?

Mr. Fletcher, you represent clients independent of Mr. Simpson.

MR. FLETCHER: Yeah, I don't have any additional questions. Thank you.

THE HEARING OFFICER: Okay. Thank you.

All right. So let's now characterize the next examination as a redirect. So let's just go in the same order as previously followed.

Ms. McHugh, questions?

MS. McHUGH: I have no redirect. Thank you.

THE HEARING OFFICER: Ms. Klahn?

MS. KLAHN: No, Your Honor.

THE HEARING OFFICER: Any of the others who questioned, further questions of Ms. Sukow?

MR. WOOD: I've got a question, Director.

THE HEARING OFFICER: Okay. Mr. Wood.

REDIRECT EXAMINATION

QUESTIONS BY MR. WOOD:

Q. Jennifer, do you recall Mr. Budge asking you a couple questions about trimline?

A. Yes.

Q. And in your professional opinion would a trimline be appropriate in this delivery call?

MR. BUDGE: Objection; foundation.

THE HEARING OFFICER: Sustained.

Mr. Wood, would you just lay a foundation with her.

Q. (BY MR. WOOD) Jennifer, do you recall Mr. Budge asking you a few questions about a trimline?

A. Yes.

Q. And what is a trimline?

A. I believe I answered that for Mr. Budge. But it's a delineation of an area where pumping has a larger than de minimis impact on the reach of interest.

Q. And so in this context, was your understanding of Mr. Budge's question whether or not you were asked to employ a trimline in this situation?

A. I think that's probably a fair characterization, yes.

Q. And in your opinion --

MR. BUDGE: Objection. It misstates the testimony.

THE HEARING OFFICER: Well, I'll allow an opportunity to clarify, if you want.

Answer the question, please. If you remember the question.

Q. (BY MR. WOOD) I'll put it this way. Ms. Sukow, what was your understanding of why Mr. Budge was asking you about a trimline?

A. I don't know why he was asking me about a trimline.

Q. Would a trimline in your professional opinion be appropriate for this delivery call?

MR. BUDGE: Objection. Mr. Director, may I comment.

THE HEARING OFFICER: What's the basis of the objection, Mr. Budge?

MR. BUDGE: In violation of the Director's order limiting the scope of testimony. So what I asked Ms. Sukow is if she had done any analysis or provided any information to the Director. I understood we can't ask her opinions on legal and policy issues based on the Director's order, and so I did not ask those questions. I just asked what analyses information she had provided

to the Director. So I don't think we can be in a position where we can't ask questions about the thinking and the group process. But then the Department can't ask those questions.

THE HEARING OFFICER: Okay. Mr. Budge, Mr. Wood, I will sustain the objection at least at this point in time. But anticipating that there will be further development and testimony regarding a trimline, and Ms. Sukow may be recalled and the question may be posed to her at that time.

Thank you, Mr. Wood.

MR. WOOD: Thank you.

THE HEARING OFFICER: Okay. Further questions of Ms. Sukow anybody?

All right. Well, the timing is perfect I guess. It's the lunch hour. So thank you, Ms. Sukow. And thank you, Colleen. So let's recess for lunch. And come back at what time; 1:00? We'll be back, convene at 1:00. Thank you.

(Lunch recess.)

THE HEARING OFFICER: We're back on the record, Colleen. One suggestion before we start. Some participating remotely have observed that it's difficult to hear objections. You are farther away from the microphone system. If you could speak up, and it might

help if you stand up. There is a microphone in the ceiling somewhere there.

Okay. Is it my understanding that Mr. Colvin is the next witness?

Mr. Colvin, if you would come forward, please.

DAVID COLVIN,

first duly sworn to tell the truth relating to said cause, testified as follows:

THE HEARING OFFICER: Mr. Thompson, you may examine Mr. Colvin.

MR. THOMPSON: Director, there should be a Surface Water Coalition binder exhibits. Probably the smallest skinniest ones back there. If you wouldn't mind getting those out.

DIRECT EXAMINATION

QUESTIONS BY MR. THOMPSON:

Q. Dave, could you state and spell your name for the record, please?

A. My name is Dave Colvin, spelled D-a-v-e, or David, David, Colvin, C-o-l-v-i-n.

Q. And where do you presently work?

A. I work at LRE Water in Denver, Colorado.

Q. And what is your occupation?

A. I'm the ground water team leader, principal hydrogeologist with the firm.

(Exhibit 3 marked.)

Q. (BY MR. THOMPSON) And in that binder we have in front of you, we have what's marked as Exhibit 3. Could you describe that, please?

A. That's Exhibit 3 is my expert report for the Fifth Methodology Order and this hearing.

Q. And is your CV attached to that exhibit?

A. It is.

Q. And does that CV generally describe your education and work history?

A. Yes, it does.

Q. Have you been qualified as an expert witness before IDWR in prior cases?

A. I have.

Q. Are you a member of the Eastern Hydrologic Modeling Committee?

A. Yes, I am.

Q. And did you participate in the technical working group last fall?

A. I did, yes.

Q. And can you generally describe what you were asked to do with that report identified as Exhibit 3?

A. I was asked to review the Fifth Methodology Order and this year's As-Applied Order for steps 1 through 3, and look at the ground water modeling issues

in particular, and evaluate the procedures that were implemented, and formulate my opinions.

Q. And do you want to describe your general conclusions or just refer to those in the report?

A. Yeah. So in my report on page 2, I have a summary of opinions. And so maybe I'll just run through those opinions. And then the rest of my report goes into greater detail. But in summary, I started with Opinion No. 1, stating that ESPAM, specifically Version 2.2 is the widely accepted as the best available scientific tool for evaluating regional ESPA hydrology, particularly reach gain impacts due to curtailing ground water pumping.

Opinion No. 2 was that the steady state use of ESPAM for curtailment analysis in particular is inappropriate due to the methodology's requirement for in-season benefits from curtailment. And so the in-season timing component renders a steady state model ineffective and inappropriate for modeling curtailment benefits. No. 3 is that the transient superposition model for ESPAM2.2 is the appropriate model for calculating the reach gain benefits from curtailing junior ground water pumping.

No. 4 is that regardless of prior approaches from other methodology orders, that transient is the

proper approach for the Fifth Methodology Order. No. 5 is that transient modeling of ESPA has been happening for over ten years for various other applications of ground water modeling.

And then No. 6 is that specific to the steady state modeling that Ms. Sukow described for proportionate share analysis of the demand shortfalls. That that steady state modeling is appropriate for that use, but only when it is applied to mitigation requirements that might be covered by direct delivery of surface water. And that that steady state modeling has no bearing on the ground water curtailment approach to mitigation.

Q. Thank you.

MR. THOMPSON: We would move to admit Exhibit 3 into the record.

THE HEARING OFFICER: Any objection to the admission of this document?

Hearing no objection the document marked as Exhibit 3 is received into evidence.

(Exhibit 3 received into evidence.)

MR. THOMPSON: And we would tender Mr. Colvin as an expert on the subjects addressed in that report for cross-examination. Thank you.

THE HEARING OFFICER: Thank you, Mr. Thompson.

Cross-examination? I want to call you, Max. What's your last name.

MR. BRICKER: Bricker.

THE HEARING OFFICER: Mr. Bricker, you may examine the witness.

MR. BRICKER: Thank you.

CROSS-EXAMINATION

QUESTIONS BY MR. BRICKER:

Q. Good afternoon, Mr. Colvin. How are you doing?

A. Great.

Q. Good. Okay. Would you agree that the Department uses ESPAM to determine which ground water users must be curtailed or must supply mitigation water to offset the predicted shortfall to the Surface Water Coalition?

A. Yes.

Q. Okay. Now, in your report, Exhibit 3, it's your opinion that transient modeling is the most appropriate mechanism to determine the actual increase in Snake River flow in the near Blackfoot to Minidoka reach that would occur in the first year of curtailment; right?

A. Yes.

Q. And you've also stated that the results from

the steady state run overestimated the curtailment benefits by more than an order of magnitude; right?

A. For in-season benefits, yes.

Q. Okay. And you've also stated that the steady state model curtailment results have been clearly demonstrated to be a grievous error; right?

A. Yes.

Q. But Department staff has been aware of the technical differences between the steady state and the transient modeling runs for many years now; right?

A. I can't speak for their awareness, but I would presume so.

Q. Okay. And the Department could have been using transient model runs before 2023; correct?

A. Yes.

Q. So is it fair to say that the use of the steady state runs in modeling was not in error, but was made as a policy decision?

A. I wouldn't be able to speculate on policy decisions.

Q. Okay. And you are aware as was asked of Ms. Sukow, that there has been a moratorium on new wells without mitigation since the early '90s; right?

A. Yes.

Q. So almost all wells have been pumping for at

least some 30 years now; correct?
A. Approximately.
Q. And looking at Exhibit 318, which was the presentation by Ms. Sukow from last November.
A. Yes. Okay. I've got it.
Q. All right.
A. Do you have a page number you are referencing?
Q. I'm looking for it myself. You know what, perhaps it isn't in this. It might be elsewhere. But would you agree that over 90 to 99 percent of the impact of pumping on the ESPA has been realized?
A. You must -- I think you might be referring to page 6.
Q. Let's see. Yes, in fact, there it is.
A. Okay. Can you restate your question?
Q. Would you agree that 90 to 99 percent of pumping impacts on the ESPA have been realized at that particular river reach?
A. Approximately, yes.
Q. So wouldn't you agree that given that, a steady state curtailment run is a reasonable estimate of the current impact on Snake River flows in that reach resulting from the current and prior pumping of those curtailed wells?
MR. THOMPSON: Objection; a compound question.

Q. (BY MR. BRICKER) Would you agree that a steady state curtailment run is a reasonable estimate of the current impact on Snake River flows resulting from current and prior pumping of curtailed runs -- or wells? Excuse me.

A. No.

Q. Okay. All right. Would you agree that the predicted shortfall in 2023 is 75,200 acre-feet?

A. That's what was in the Fifth Methodology Order -- or the As-Applied Order, yes.

Q. Okay. So looking back at that Exhibit 318, looking at page 13, the "Comparison priority dates calculated for DS forecasts," the first of those two pages. Curtailment of wells junior to sometime in the mid-1980s would produce 75,200 acre-feet in the near Blackfoot to Minidoka reach based on steady state modeling; right?

A. It's hard to see in this graph here, but it seems about right.

Q. Sometime in the mid to late '80s?

A. Sure.

Q. So in other words, the current and prior pumping of wells junior to the mid-1980s is currently depleting the near Blackfoot to Minidoka reach by about 75,200 acre-feet given that slide; right?

A. That would be the impact on the reach gains there, so, yes.

Q. Okay. So if the wells junior to the mid-1980s had not started pumping, there would be an additional 75,200 acre-feet in the river at that reach in 2023; right?

A. If they had never started pumping, that would be about the increase in reach gains, yes.

Q. Okay. So as a result, if the pumping of the wells junior to the mid-1980s did not happen, there would be no forecast shortage to the Surface Water Coalition members; right, in 2023?

A. That's possible. And a very different analysis than curtailment.

Q. Okay. Would you agree that it may be unduly burdensome to curtail wells senior to the mid-1980s if it were that those wells senior did not cause the 75,200 acre-foot shortage in 2023?

A. I haven't evaluated the burden of curtailment, but the impacts to reach gains are due to the cumulative pumping across the ESPA for many decades. And so you can apportion it how you want, which is essentially what IDWR did with their proportionate share analysis but -- I guess can you restate your question?

Q. Sure. It was does it seem unduly burdensome

to force wells senior to the mid-1980s to be curtailed if they were not the cause of the 75,200 acre-foot shortage in 2023?

A. Well, again, I haven't evaluated the burden of curtailment compared to being involved in an agreement or mitigating by some other measure. So I guess I don't know.

Q. How about instead of to force curtailment, but to require mitigation water from?

A. Again, I haven't reviewed the burden of what forced mitigation would require. So I don't really know how to answer that question.

Q. How about if you change burden to, is it fair to require mitigation or curtailment of those rights?

A. I guess I don't know what you mean by "fair." But according to prior appropriation, if you mean is it a priority date; is that fair? And I think under prior appropriation administration, a priority date that returns the demand shortfall to the Surface Water Coalition is fair.

MR. BRICKER: Thank you. I have no further questions.

THE HEARING OFFICER: Further cross-examination?

Mr. Budge.

CROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Good afternoon, Mr. Colvin. Do you mind if I call you "David"?

A. That's fine.

Q. I have just a few questions.

(Exhibit 306 marked.)

Q. (BY MR. BUDGE) First, if I could have you turn to Exhibit 306.

A. Okay.

Q. What's that document title that you are looking at?

A. This is the Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover."

Q. Thank you. That's the right one. I refer to that as the Fourth Methodology Order. Were you working for the Surface Water Coalition back when that was issued?

A. No, I was not.

Q. When did you begin working for the Coalition?

A. I believe it was 2019 --

Q. Okay.

A. -- maybe 2018.

Q. And what type of work have you done for the

Coalition since then?

A. Evaluation of Eastern Snake Plain Aquifer hydrology related to transfers or the agreement with IGWA, monitoring the Eastern Snake Hydrologic Modeling Committee and participating there, being involved in technical work groups related to the sentinel well tracking, and recharge planning, various other activities on the plain.

Q. Is the methodology order that we're discussing here, is that within the purview of the representation you provide for the Coalition?

A. Yes.

Q. And you mentioned that you participate on the Eastern Snake Hydrologic Modeling Committee?

A. Yes.

Q. Did you participate in the 2015 technical working group that the Department held regarding the methodology order?

A. I did not.

Q. Okay. Back to that exhibit you've got in front of you. If you could flip to page 35?

A. Okay.

Q. About halfway down, there is a heading that says "Order." And then it begins walking through the steps of the methodology order. I assume you are

familiar with all of the steps?

A. Yes.

Q. Step 1, which you are familiar with, requires members of the Coalition to report annually their irrigated acreage to the Department. Are you familiar with that step?

A. Yes.

Q. As a consultant for the Coalition, has the Coalition or any member of the Coalition ever asked you to help them evaluate the irrigated acres within their service area?

A. No, that's kind of out of my specialty. I'm more ground water focused.

Q. Got you. Are there people in your firm that have that type of expertise?

A. There are.

Q. But that's not something the Coalition has ever asked for your help with?

A. No.

Q. Have they ever shared with you the reports that they submit to the Department, where they report their irrigated acreage?

A. Not shared with me directly. I've seen them posted, though.

Q. Okay. But that's not a component of the

methodology that they've consulted your advice in relation to?

A. No.

MR. BUDGE: Okay. I don't have any further questions.

THE HEARING OFFICER: Further examination of Mr. Colvin?

Okay. Any redirect, Mr. Thompson?

MR. THOMPSON: I don't have any.

THE HEARING OFFICER: Mr. Colvin, you are off easy.

THE WITNESS: Okay.

(Witness excused.)

THE HEARING OFFICER: Now, I understand the next witness in the list is Matt Anders, an employee of the Department.

If you'd come forward, Matt.

MATTHEW "MATT" ANDERS,

first duly sworn to tell the truth relating to said cause, testified as follows:

THE HEARING OFFICER: Mr. Wood, you may examine.

DIRECT EXAMINATION

QUESTIONS BY MR. WOOD:

Q. Hello, Mr. Anders.

A. Hello.
Q. Can you please state and spell your name for the record.
A. My name is Matthew Anders. I go by Matt, M-a-t-t, A-n-d-e-r-s.
Q. And what is your educational background?
A. I have a bachelor's in geology from Gustavus Adolphus College, and a master's in geology from Utah State University.
Q. And you're a licensed professional geologist in Idaho; is that correct?
A. I am.
Q. And you are currently employed at the Idaho Department of Water Resources?
A. I am.
Q. And how long have you worked for the Department?
A. Worked a total of 18 years. I was a contractor for about the first three. And then I worked for the Department directly for about 15.
Q. And you are the technical services bureau chief; is that correct?
A. I am.
Q. And how long have you been in that position?
A. About four months.

Q. And what are your duties as the technical services bureau chief?
A. I either oversee directly or indirectly staff from the hydrology section and the GIS section.
Q. I would like to turn your attention to the Fifth Methodology Order.
A. Okay.
Q. Are you familiar with that document?
A. Yes.
Q. And some of that document you know quite a bit about?
A. Yep, I do.
Q. And that you even played a role in developing some of that data?
A. Yes, I did.
Q. And this is why you've been called as a witness here today?
A. I believe so, yes.
Q. And you are aware that the Department has identified nine topics for you to testify; is that correct?
A. Yes.
Q. And I'm going list those line, and let me know if this is correct. Okay?
A. Okay.

Q. Baseline year, forecast supply, surface water irrigated acres, crop water needs. I am going to try hard not to screw this one up -- near real-time mapping evapotranspiration of high resolution with internalized calibration?

A. It's evaporation, but, yes.

Q. See, I knew I wouldn't do it right. All right.

Project efficiency?

A. Yes.

Q. Reasonable carryover?

A. Yes.

Q. Twin Falls Canal Company's increase in diversions?

A. Yes.

Q. And that 2023 technical working group meetings?

A. Yes.

Q. Do you have any concerns that you were unqualified to discuss those topics here today?

A. No, I do not.

Q. One additional issue, Mr. Anders. You brought to our attention some shapefiles that were not included in the original, I guess we'll call it, a data dump on May 5th; is that correct?

A. Correct.
Q. And as I understand it, we provided to the parties the 2022 shapefiles for Minidoka and Milner. And what we meant to provide was the 2023 shapefiles; is that correct?
A. Correct.
Q. And the 2023 shapefiles are what is used in the Fifth Methodology Order?
A. Yes.
Q. And those numbers are correct?
A. The methodology order, the acres that we used, they are correct, yes.
Q. And you provided a zip file that had those two files in them; is that correct?
A. Yes, I did.
Q. And we provided those to the parties this morning. Did you have you an opportunity to look at those files and ensure their accuracy?
A. Before I gave them to you, I inspected them, yes.
Q. Okay. And do you think they are a reasonable representation of what those shapefiles are, the accuracy of the shapefiles?
A. Yes, I do.
MR. WOOD: And with that, Director, we would

move to admit the Minidoka and Milner 2023 shapefiles.

THE HEARING OFFICER: I assume that what you are asking me to do is take official notice of them?

MR. WOOD: Or take official notice of them, sure.

THE HEARING OFFICER: Any objection from the parties?

Okay. I will take official notice of the 2023 shapefiles from Milner and Minidoka as represented.

Thank you, Mr. Wood.

MR. WOOD: The Department has no further questions for Mr. Anders.

THE HEARING OFFICER: Okay. Examination of Mr. Anders by the ground water users?

Ms. Klahn, I see you turning in your seat.

MS. KLAHN: That's right.

THE HEARING OFFICER: Welcome to the podium.

CROSS-EXAMINATION

QUESTIONS BY MS. KLAHN:

Q. Good afternoon, Mr. Anders. I'm Sarah Klahn, representing the City of Pocatello. And it's nice to see you in person after seeing you on Zoom for two days.

I wanted to start by asking you some questions about the Fifth Methodology Order. You should have a notebook up there with a 300 series of exhibits in it.

And you would be looking at Exhibit 300?

A. Binder one of Exhibit 300. And you said tab 300?

Q. Yes.

A. Yes, I have it.

Q. Okay. And let's turn, if you would, in Exhibit 300 to page 12. Starting at paragraph 29, there is a section of the order related to project efficiency. And that's one of the topics you were disclosed for; right?

A. Yes, it's at the bottom of the page.

Q. I wanted to ask you about the statement at the bottom of the page there. The statement in paragraph 29 says, "Project efficiency is the ratio of total volumetric crop water needs within a Surface Water Coalition entity's boundary and the total volume of water diverted by that entity to satisfy its crop needs." The second sentence says, "It is the same concept as efficiency, which was presented at the hearing."

What's your understanding of what was presented at the hearing? Or let's start with, which hearing are we talking about; do you know?

A. I don't know.

Q. Okay. So this wasn't a sentence that you have

any knowledge of?

A. No, I didn't add that sentence.

Q. Okay. Well, let's flip over then to page 13. And there is an equation at the top of the page. And above that equation is some narrative about the relationships that are contained in project efficiency. And I want to ask you about those. So the first component listed there is "seepage loss." Do you see that?

A. I do.

Q. What is seepage loss in your understanding?

A. As water is -- after it's been diverted and is being sent or conveyed to get to the place of use for the water, there are losses out of the canals. Maybe they are unlined. There is some small amount of evaporation. If there happens to be vegetation, they may be pulling. So it is kind of any losses in route to where the water is going to be applied.

Q. Okay. The second item listed there is on-farm application losses. And the first example is deep percolation. Do you have an understanding of what that means?

A. To me, deep percolation is when the soil becomes saturated, because you are applying water. And you get infiltration down below the root zone, so the

plants can no longer access it. And it may stay there, or it may go farther all the way to the aquifer, depending how much water is available.

Q. Okay. The second is "field runoff" listed there in that parenthetical at the top of page 13. How would you characterize "field runoff"?

A. To me, that's over land flow. So it's on the surface of the land. Either the water is applied too quickly, and it can't infiltrate, or the soil is saturated. But in any either case, the water is running off to someplace outside of the field.

Q. Okay. And then the third item there listed is "system operational losses," and the parenthetical is "(return flows)." How is that different in your understanding from the other seepage and the on-farm application losses?

A. I think of return flows as at the end of the system, there is water that's needed to get to deliver water to the end of the system. And there is always excess water there. That water, I think where return flow, the term comes from, either returns to the original source or a different source of water.

Q. Okay. Now, the sentence up there at the top of the page of page 13, goes on to say, "system operational losses for which data is not obtainable by

the Department." Do you see that?
A. I do.
Q. But the Department has data associated with Twin Falls Canal Company return flows; isn't that right?
A. We have some of the return flows monitored through our Eastern Snake Plain's spring and return flow monitoring program. But we don't have everything monitored.
Q. Were you in the room this morning when Ms. Sukow testified?
A. I was.
Q. And you heard her testify about the incorporation of Twin Falls Canal Company return flow data to calibrate the model?
A. Yeah, I heard her say that.
Q. Okay. And so your understanding is that the Department has some Twin Falls return flow data, but there is more that you don't have?
A. I think there are some return flows that are small enough that were not -- we have decided not to monitor.
Q. And are you aware that the return flows associated with Twin Falls Canal Company operations are in the neighborhood of 300,000 to 400,000 acre-feet a year?

MR. THOMPSON: I'm going to object to that question; characterization, foundation.

MS. KLAHN: I asked him if he was aware.

THE HEARING OFFICER: Overruled.

THE WITNESS: I'm not sure I knew that it was that exact number. I've seen numbers, presentations where they've talked about it, but I don't remember that number specifically.

Q. (BY MS. KLAHN) All right. Let's talk for a minute about that equation at the top of page 13. Could you sort of just walk us through how the calculation works, what each of the variables are?

A. Sure. The Ep is the project efficiency. And that is equal to the crop water need, divided by the demand or the diversion, the Q, the discharge of the diversion. Crop water need is composed of, we use ET, we use precipitation, we use acres to calculate that. The diversions are, those are directly measured that we take from water right accounting.

Q. Okay.

A. From Water District 1.

Q. From Water District 1?

A. Yeah.

Q. Okay. So tell me if this is correct from a mathematical perspective. As the irrigation diversions

go up, the project efficiency will go down. As the denominator gets larger, the project efficiency gets smaller; is that true?

A. If the crop water need stays the same, yes.

Q. Okay. In your work with the Department on the methodology order, have you done any evaluation of whether the project deficiencies that you are measuring using this calculation are reasonable?

A. When we're doing our calculations, we are always doing, you know, quality control, quality assurance to see if the numbers make sense. And that's on a technical level. You know, did it compare to previous years, or compared to the previous month, is it a reasonable number? So all of our calculations go through that. We make our calculations. And Kara Ferguson and I switch and review each other's data. So just on the reasonableness of the calculations, yes, on a numbers basis we're looking at.

Q. You were the lead of the technical work group in November and December of 2022; is that right?

A. Yeah, correct.

Q. And there was some discussion there of project efficiency and the methods that the Department uses to calculate those. Do you recall that?

A. Yeah, I gave a presentation on project

efficiency.

Q. And Greg Sullivan, one of the consultants for the Cities in this proceeding, provided some input on alternative ways of looking at project efficiency using the same kind of calculation that the Department was using, but made some suggestions about other ways to look at it. Do you recall that?

A. My recollection of, at the technical working group, he presented us some graphs looking at the relationship between crop water need and project efficiency. I don't remember at that time that he made a proposal about different ways to calculate it. But he did in his expert report at a later date. He may have stated that at the technical working group. I don't remember it. But I do remember it from his technical, his expert report.

Q. During the technical work group process was there any conversation internally in the Department about taking another look at how to do project efficiencies, keeping in mind that you want to use this kind of equation, but to try and I mean get a more meaningful project efficiency measure?

A. We, on a technical level, we have discussed, you know, the accuracy of the project efficiency, and where errors may come in that calculation. But we

haven't gone down the road of like proposing, or even working out possible ways to calculate it differently.

Q. Thank you. Could we turn now to page 10 of Exhibit 300, please? And you'll recall during our deposition, I had quite a log of questions for you on acreage?

A. Yes.

Q. So based on the table that's shown in Exhibit 300, paragraph 22, the Department used the Twin Falls Canal Company 2013 shapefile for purposes of Twin Falls Canal Company acreage in this Fifth Methodology Order; correct?

A. Yes.

Q. And I think you've testified during your deposition, that this Twin Falls Canal Company acreage shown in the table does contain hardened acres. Do you recall that?

A. Yes.

Q. In other words, hardened acres would mean they can't be irrigated?

A. Yeah, correct.

Q. And we also talked during your deposition about the Department's previous reliance in earlier methodology orders on lower numbers for Twin Falls Canal Company acres. Do you recall that?

A. Yes, I believe it was about 183,000, and I think they came from SPF.

Q. I think that's right.

(Exhibit 324 marked.)

Q. (BY MS. KLAHN) So let's take a look at some of those values. I would like you to find in that same notebook, I think in that same notebook, it should be Exhibit 324.

A. No, this one only goes to 313.

Q. I guess it's in, we'll guess, Volume 2.

MR. WOOD: It should be in that.

THE WITNESS: Could you repeat the number I'm looking for?

Q. (BY MS. KLAHN) Sure. It should be a 2015 PowerPoint that you prepared.

A. Yep, I'm to Exhibit 324.

Q. Okay. Could you identify that, please, for the record?

A. The title -- well, it looks like it is a printout of a PowerPoint presentation titled "Proposed Modification to Method Determining Reasonable In-Season Demand for the Surface Water Coalition: Irrigated Acres for SWC Members, Presented to the SWC Methodology Technical Working Group by Matt Anders, February 19, 2015."

Q. Okay. Let's turn, the pages are not numbered. I believe it's page 3. There is a table.

A. "Summary of irrigated acres" is the bullet?

Q. Correct. And I want to draw your attention to the bottom row of the table there, which shows the SPF acres you referenced a minute ago, 183,589. So in 2013, if we go all the way over to the right, "2013 RISD," what does that column represent?

A. That is acres that we used for the 2013 order for the reasonable in-season demand calculation.

Q. Okay. So that number was used in 2013. The same number was used in 2015; wasn't it?

A. Reviewing what we call the calculator, it looked like that number was use from 2010 to 2014.

Q. 2014?

A. Yeah.

Q. You didn't use it in 2015?

A. When I looked at the calculator, we changed it in 2015.

Q. Okay.

A. But that's based on what I see in the calculator.

Q. Okay. Can I hand you -- or I'm not going to hand you, because hopefully you have it in front of you. We're looking at the IGWA notebook, Exhibit 135.

(Exhibit 135/306 marked.)
MS. KLAHN: TJ, any idea if that is Volume 1, 2, or 10?
MR. BUDGE: The numbers are on the binder.
THE WITNESS: They are in the common exhibits.
MS. KLAHN: No, it's in IGWA 135.
MR. SIMPSON: It's the same as 306.
MS. KLAHN: Yes.
THE WITNESS: I'm at Exhibit 135.
Q. (BY MS. KLAHN) Thank you. Would you identify Exhibit 135 for the record, please?
A. It says it's the "Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover."
Q. And then let's turn to the last page. Actually, let's turn to page 39.
MR. FLETCHER: Sarah, for the record, it's already been admitted under a different number.
MS. KLAHN: Oh, it has. I apologize. I missed that.
MR. FLETCHER: Well, we don't want any confusion.
MS. KLAHN: Well, let's keep using 135, but I won't admit it. How is that? I will start talking about it as 306.

MR. FLETCHER: I just thought we should have it on the record, it has been marked as 306.

Q. (BY MS. KLAHN) Okay. Let's not switch the exhibit notebooks.

A. Okay.

Q. But I'm going to refer to this as Exhibit 306?

A. Okay.

MS. KLAHN: Thank you, Kent.

THE WITNESS: I forgot the page number.

Q. (BY MS. KLAHN) 39.

A. All right. I am there.

Q. And that this Fourth Methodology Order is the final order signed by the Director; correct?

A. Yes, it appears to be.

Q. Okay. Now, I would like you to look through the Fourth Methodology Order, Exhibit 306, and find the paragraph where the Twin Falls Canal Company acres used in the Fourth Methodology Order are identified. And I'm not meaning to belabor the suspense. I can't find a spot in there, which it is identified, which is why I wanted you to look at it, and see if that's accurate?

A. I believe that that's accurate.

Q. Okay.

A. And that we started that table which was new in the Fifth Amended Methodology Order of adding the

acres.

Q. Okay.

A. Generally, I think we add the acres, I can't remember, it's either for each year in the April or the July in the as-applieds. They weren't in the fourth amended, I believe.

Q. Okay. That's fair. All right. And so this Fourth Methodology Order was signed by Director Spackman in 2016. So by 2016, you were still using the 2013 shapefile number of 194,000 acres or so for Twin Falls Canal Company; correct?

A. I believe, yeah, we were.

(Exhibit 325 marked.)

Q. (BY MS. KLAHN) Now, let's switch over and take a look at Exhibit 325.

A. Yes I've got it.

Q. And could you identify Exhibit 325 for the record, please?

A. It looks like a printout of a PowerPoint titled "Proposed Modification to Method for Determining Reasonable In-Season Demand for the Surface Water Coalition: Use of the Near Real-Time Metric," Presented by Ethan Geisler, Kara Ferguson, and Matt Anders, on December 1st, 2022.

Q. And I apologize, these pages are not numbered,

but I believe it's page 19. There is a table that's titled "Surface Water Coalition Irrigated Acres." Could you find that, please?

A. I think I'm on that. The first table or the first column is "SWC Member," and the last one is "Methodology Acres"?

Q. Correct. Thank you.

A. Okay.

Q. So let's talk about each column for a minute. So the first column is "SWC Member," as you said. The second column is titled "Created by SWC for IDWR PPU." What does that stand for?

A. It's the source of the shapefile. Whether it was created by a Surface Water Coalition member or sent to us, or it was created by us during the Snake River Basin Adjudication. "PPU" stands for permissible place of use.

Q. Then the next column, "Date of Shapefile," what does that tell us?

A. If it was submitted by the Surface Water Coalition, it was the year that we received it. If it was a permissible place of use, they all have a 2010. That was my understanding of when they were created.

Q. Okay.

A. Or maybe last updated. Maybe not created, but

the last version.

Q. The next column is the "Shapefile Acres." That's self-explanatory; would you agree?

A. Agreed.

Q. The next column is "If Remove Nonirrigated Acres With 2011 Irrigated Lands Dataset." What does that column represent?

A. I'm on a different table. I'm on "CDL Processing Acres." Am I on the wrong one?

Q. Yeah, you are on the wrong one. And that's probably my fault.

A. Well, wait. Three pages later, there is another table.

Q. Let's do that one.

A. Okay. The same, and it says, "If Removed Nonirrigated Acres with 2011 Irrigated Lands Dataset."

Q. Right. And so for purposes of the record, we should be on page 22 of that exhibit, I think?

MR. FLETCHER: It was page 19.

MS. KLAHN: Is it page 19. It was correct. Okay.

THE WITNESS: Okay.

Q. (BY MS. KLAHN) Sorry.

A. I was just -- I didn't count. I just went to it.

Q. That's okay. That's all right. So let's stick with that column. What does it stand for?

A. Those are the acres, if we did a GIS analysis using the 2011 IDWR irrigated lands dataset, if we removed all the polygons in the 2011 dataset. All that area under the non-irrigated from the shapefiles that they list here, either PPU or from the Surface Water Coalition.

Q. Okay. And focusing on Twin Falls Canal Company, if we look at the bottom row, the difference in acres, the Surface Water Coalition's shapefile is 194,727. If you remove the non-irrigated acres with the 2011 irrigated lands dataset, it goes to 179,486; is that right?

A. Correct.

Q. And then the next column over is titled, "If Remove Non-Irrigated Acres with 2017 Irrigated Lands Dataset." What does that tell us?

A. The same thing as we did with the -- or the same process with the 2011 irrigated lands dataset. We did it with the 2017 irrigated lands dataset.

Q. Okay. And then the final column is the column that has been of acres that has been used in the methodology order since the Fourth Methodology Order?

A. Yes, I think it's since the third. The third

came out in 2015.

Q. Okay.

A. I think that's what we've used those acres since then, or Twin Falls specifically since then.

Q. Okay. And before we go on, let's just stop for the record. What is the IDWR irrigated lands dataset?

A. Jennifer was asked this same question. I thought she gave a good answer. It is a -- hopefully, I can give the same answer. It is a dataset that we prepare here at IDWR. We use -- we prepare it by hand. We use several different types of data to create polygons on the Eastern Snake Plain, and then classify them as irrigated, non-irrigated, or semi-irrigated.

Q. Okay. The Twin Falls Canal Company row that we've been looking at shows two acreage numbers that are derived from using the 2011 and 2017 irrigated lands dataset that are roughly 13,000 acres smaller than what's used in the methodology order; correct?

A. Yeah, roughly.

Q. And Ms. Sukow testified this morning that the IDWR irrigated lands dataset is used to calibrate the model. Were you aware of that?

A. I was aware of that, yes.

Q. And yet, during your deposition you testified

that you didn't think the irrigated lands dataset was sufficient to satisfy the clear and convincing standard. Do you recall that?

A. I do recall that.

Q. And in 2017, soon after, you issued the Fourth Methodology Order, you had a brand-new irrigated lands dataset. So why not incorporate that into the methodology and use that instead of the larger shapefile number?

A. So until -- so since about 2015, I haven't been using the irrigated lands dataset at all. So it wasn't a consideration when, in 2017, that I would use that. I wasn't using one to remove the non-irrigated acres. Which was an oversight on my part, because at the same time I was doing that, I was working on the near real-time metric and removing the irrigated acres -- or the non-irrigated acres with the irrigated lands dataset. So it was an inconsistency between processes I had going.

Q. Would you agree the Department's hand digitized maps that are created using the irrigated lands dataset process are highly accurate?

A. I think they are highly accurate for the year that they are created for.

Q. So in an ideal world, there would be a new

irrigated lands dataset every year, and that's what you would use in the methodology order?

A. To use your term "ideal world," yes.

Q. And in the meantime, the dataset you are using is at least ten years old. And you would acknowledge that there is hardened acres incorporated in it; right?

A. Correct.

Q. So right now, the difference between the 2017 irrigated lands dataset and the methodology acres is roughly, what; eight, nine percent difference?

A. Okay. Rough math, sure.

Q. Yes. At some point as the technical lead on the methodology analyses, is there a threshold at which you say, we simply can't use this 2013 dataset anymore from Twin Falls, because it's simply too inaccurate based on what our hand digitizing is showing?

A. Until we get something that passes, or that I feel passes the, or achieves the clear and convincing, I think we're going to use that. The clear and convincing by Judge Wildman of, if you are going to reduce the acres, you have to be clear and convincing.

Q. So the standard isn't really clear and convincing, it's whether or not Judge Wildman has blessed it; is that fair?

A. I don't know the answer to that.

Q. So for purposes of the Fifth Methodology Order, have you done any investigations into Twin Falls Canal Company return flows?

A. Not as part of the order.

Q. You had a conversation with Mr. Barlogi, who's the manager of Twin Falls Canal Company, about their return flows at some point, though; didn't you?

A. I don't think I've ever talked to him, that I remember.

Q. About return flows and their impact on the Murphy gage flows?

A. I stand corrected. As part of the Swan Falls technical working group and work we were doing there, I think -- I can't remember exactly. I may have sat in on a call with Collin Macheel with Mr. Barlogi. I'm not sure on that. I've talked to Collin several times about return flows at Twin Falls. I can't remember if I sat in on a call or not.

Q. Well, Mr. Barlogi testified he was on a call with you in January of this year about Twin Falls Canal Company return flows. And the timing to me was interesting, because it was when the methodology order was being, I guess, being drafted. So that's the source of my question.

In your experience, have you evaluated whether

Twin Falls Canal Company return flows contribute to Swan Falls gage flows -- or sorry -- Murphy gage flows?

A. Yes. And I think that's what that call was about. As we were preparing data to present to the Swan Falls Technical Working Group, that was going on at the same time. We have calculated the contribution at the Murphy gage for what they call the adjusted average daily flow at Swan Falls.

Q. Let me ask you another question related to the Twin Falls Canal Company.

MS. KLAHN: Let's mark this as Exhibit 362.

(Exhibit 362 marked.)

Q. (BY MS. KLAHN) So, Mr. Anders, you've been handed Exhibit 362, which is a contract between the Idaho State Board of Land Commissioners and Twin Falls: Land & Water Company, dated January 2nd, 1903. And I'll represent to you that this is the basis for one of Twin Falls Canal Company's water rights. I would like you to take a look in here at the section --

Well, first of all, have you ever seen this?

A. No.

Q. And so are you familiar with the fact that this describes five-eighths of an inch delivery as the basis for deliveries of water under the Twin Falls Canal Company water right?

A. No.

MR. THOMPSON: Director, I'll object to this exhibit. I guess we need inquiry that it represents the water rights of the canal company. Those rights have been decreed. And I think they are in the Department's files.

THE HEARING OFFICER: Well, these questions are foundational. I'll overrule the objection at least for the moment, Ms. Klahn.

Q. (BY MS. KLAHN) So if you haven't seen this contract before, you are not familiar with the fact that there is a term in here that requires rotation of deliveries at the Twin Falls Canal Company?

A. I'm not familiar with that.

Q. And so when you're doing your evaluations for baseline year for the Twin Falls Canal Company, you don't consider any of this kind of information; isn't that right?

A. No.

MS. KLAHN: Okay. That's all I have.

I would like to move for admission of Exhibit 362, 325, and 324.

THE HEARING OFFICER: Any objection?

MR. THOMPSON: Yeah, I'll object to this exhibit, again. Ms. Klahn, is characterizing it as

conditions of the water right, and how it should be delivered. This is not the partial decree in the SRBA. It doesn't have any sort of general provisions for administration relating to this contract.

So what she's offering it for is a mischaracterization of the water right that's been decreed, in descriptive by the state laws.

MS. KLAHN: Mr. Director, if I may be heard?

THE HEARING OFFICER: Sure.

MS. KLAHN: We can before tomorrow morning, produce the SRBA related documents relating to these kinds of elements of the water right. Originally in 2012, I think it was, the City of Pocatello filed a protest against the Twin Falls Canal Company claims in the SRBA asserting the delivery be related to five-eighths instead of three-quarters, some stuff happened. We entered into a stipulation with Twin Falls about the fact that this would not be decided in the SRBA. That these were elements of administration.

So these are elements that we're asserting should be taken into consideration, because they aren't on the face of the partial decree, and that was by agreement. And if you if you'd like to reserve, and wait for something to be provided, we're happy to do that.

MR. BUDGE: Just one comment.
THE HEARING OFFICER: Mr. Budge.
MR. BUDGE: Director, if you want to look at the SRBA filing that Ms. Klahn is referring to, it's Exhibit 179. And it's an SF5 filed with the SRBA court. So it is the type of document that the Department would typically take judicial notice of.
THE HEARING OFFICER: My reaction is this, Mr. Budge, and, Ms. Klahn. I would take notice of the decrees. I would take notice of the SF5. But do I take notice of a contract document that's been presented to me, that I know nothing about, and Mr. Anders knows nothing about, and receive this into evidence. I mean, it needs to have foundation. And Mr. Anders is not the witness by, or through whom this document should be presented.
So I'll receive into evidence exhibits marked as Exhibits 324 and 325. And I won't allow what's been marked as Exhibit 362 into evidence at this time.
MS. KLAHN: Thank you.
(Exhibits 324 and 325 received into evidence.)
THE HEARING OFFICER: It can be re-offered if there is sufficient foundation, Ms. Klahn.
MS. KLAHN: Okay. Thank you.
MR. FLETCHER: So excuse me. You admitted 324

and what was the other one?

MS. KLAHN: 325.

THE HEARING OFFICER: 325.

MR. FLETCHER: Thank you.

THE HEARING OFFICER: They were presentations by Matt Anders to the Surface Water Coalition technical working group.

Mr. Budge?

MR. BUDGE: One housekeeping item, did Exhibit 306 get admitted into evidence?

THE REPORTER: No, I don't have it.

MS. KLAHN: I misunderstood, Mr. Fletcher. I thought he said it had been used and admitted. So I'll offer Exhibit 306 as well.

THE HEARING OFFICER: So 306 is being offered as 306, not as a combined exhibit?

MS. KLAHN: Yes.

THE HEARING OFFICER: Any objection to the admission of Exhibit 306?

Hearing no objection, the document marked as Exhibit 306 is received into evidence.

(Exhibit 306 received into evidence.)

THE HEARING OFFICER: Further examination of Mr. Anders?

Mr. Anderson.

///

CROSS-EXAMINATION

QUESTIONS BY MR. ANDERSON:

Q. How are you doing, Matt?

A. Good. Thank you.

Q. You should have the methodology order exhibit. Is that still in front of you, 300?

MR. FLETCHER: 301.

Q. (BY MR. ANDERSON) 301.

A. 301.

THE HEARING OFFICER: I think it's 300; isn't it?

MR. ANDERSON: I thought it was 300.

MR. FLETCHER: You mean, the Fifth Methodology?

MR. ANDERSON: I'm sorry. Yes, the Fifth Methodology. The As-Applied is 301.

MR. FLETCHER: Yes.

THE WITNESS: Yes, I have 300.

Q. (BY MR. ANDERSON) Would you go to paragraph 9, and it kind of goes on to page 4 there. I am more curious about the last two sentences there. It says it starts with "an above average diversion year."

A. On page 4. Okay.

Q. Yeah. At the top of page 4.

A. Yes, I see it.
Q. Would you mind just reading that sentence for us?
A. Sure. "An above average diversion year or years selected as the baseline year should also represent a year or years of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors."
Q. Could you help me understand what those other factors might be?
A. I'm not sure.
Q. Okay. So then is it safe to conclude that an above average diversion year wouldn't matter whether it was above average temperatures, if they divert, they divert? If you cannot identify what other factors it might be, why does it need to be above average temperatures?
A. Well, I don't quite understand the question.
Q. Well, I'm just trying to understand the methodology order as it's stated. It gives the list of factors in choosing the baseline year. And it says "to ensure that the increase in diversions were from a crop water need and not other factors." I don't know either. I'm trying to understand what those other factors are?

But I've asked and answer -- I'm not trying to put you on the spot and make you come up with an answer. If you don't know what those other factors are, that's fine.

A. Okay.

Q. Do you believe there are other factors without naming them?

A. Not that I can think of.

Q. Okay. Let's go to paragraph No. 28.

A. On page 12, correct?

Q. Yes. Okay. There is a quote here at the end of 28. And I'll read it this time. I won't put everything on you. It says, "The concept of a baseline is that it is adjustable as weather conditions or practices change, and that those adjustments will occur in an orderly, understood protocol." Are you with me on the same --

A. I did see that sentence. Yes.

Q. So I have a question. Did weather conditions change in the last seven years to prompt a change in the baseline year?

A. I don't think significantly.

Q. Did practices change?

A. I think the crop mix, crop type, and maybe some harvesting methods may have changed in that time.

Q. Okay. And maybe you can just direct me, which

part of the methodology order looks specifically at that crop mix and --

A. The crop mix is part of the crop water need calculation.

Q. Okay. Do you calculate the change in that crop water need, and evaluate it as a requirement to update the baseline year?

A. Could you restate that question?

Q. Sure. Sure. Maybe I can rephrase it and give a little foundation for it.

The concept of baseline year as it says, it's adjusted as whether conditions change or practices change. So my question is, do you evaluate the crop water need and determine these practices changes?

A. We are evaluating the crop water need. We are also over time watching, especially over the last few years, watching the baseline year to see if it still meets the criteria.

Q. Understand. And could you explain just the orderly and understood protocol for changing a baseline year?

A. The only way a baseline year could be changed is through an order issued by the Director.

Q. The crop water need that you are talking about that you say, the practices changes would show up in the

crop water need; is that correct?

A. They can.

Q. They can?

A. Yeah.

Q. Is there any other way that they could be manifested?

A. I think changes in crop type or crop mix that are being grown can show up in diversion. It can show up in project efficiency. These are all pieces that we're calculating.

Q. But you don't look specifically for changes in practice, those will just show up as a difference in efficiency; correct?

A. Yeah, we're not specifically tracking -- I think I see now. We're not specifically tracking what are their harvesting practices or things like that. We are watching the crop. We do calculate the crop mix. But you are right, that changes in practices, we would only see like the secondary effect of that. It would show up in some kind of number that we're calculating.

Q. I want to talk to you a little bit. I'm kind of confused about the clear and convincing standard that you apply to the crop water acres --

A. Yes.

Q. -- or the irrigated acres? Sorry. Not a

crop water acres.

A. Yes.

Q. What data, I guess, that you would consider needs to meet that clear and convincing standard?

A. I think it has to -- the data have to be timely and accurate. And when I say "timely" --

THE HEARING OFFICER: Go ahead.

THE WITNESS: When I say timely, to use a term used by Ms. Klahn, is it would be really nice to have it in-season, but that's impractical.

Q. (BY MR. ANDERSON) Okay.

A. So as soon as we could get, you know, something recent. That's what I mean by timely.

Q. Not to nitpick you. That's still a different standard than clear and convincing. I'm trying to understand the clear and convincing standard that you apply to the irrigated acres. You said it wasn't clear and convincing. Maybe you could explain what part of the study that the Department did was unclear first?

A. You are talking the 2017 irrigated lands dataset?

Q. Yes, I believe that's what Ms. Klahn was talking about when you gave that answer.

A. Okay. So the part of that to me is that was created in 2017. So while it has the accuracy, I think

the timeliness of that dataset does not meet the standard of clear and convincing. You can open that dataset and see acres that are considered non-irrigated. Overlay it on a recent air photo, maybe a 2021 or something a 2022, and see that it is irrigated.

So to me, that's not convincing that those acres should be removed. They said in the 2017, that dataset indicates that they should be removed. But if we look at recent air photos. It shouldn't be. They are irrigated.

Q. And the Department has done those studies, recent studies of irrigated acres?

A. It was just a preliminary analysis to see what does it look like compared to current conditions, the 2017. So we did not do a full-blown project or analysis of it. It was more of a preliminary.

Q. And with that study, did you find acres that were considered irrigated back then, but are no longer appearing to be irrigated acres?

A. I didn't identify any, but I would say it's likely that there are exactly that.

Q. Is there any other data or evidence that you think needs to meet a clear and convincing standard that you did not consider in this methodology order, because it did not meet that standard?

A. Can you repeat that question?
Q. That was a little bad. I'll take that.
Is there any data or information that you didn't consider as part of this methodology order, because you felt it didn't reach that clear and convincing standard?
A. I think that the supplemental ground water is the same, is in the same category that to adjust the acres downward, it needs to be clear and convincing.
Q. Okay. But all the other data that you used, you felt was clear and convincing?
A. I'm not sure that that standard is applied to everything. When Judge Wildman, at least the piece that I have read, was talking about irrigated acres, not the methodology as a whole.
Q. Okay. I understand. I want to talk a little bit maybe about the recommendations.
(Exhibit 914 marked.)
Q. (BY MR. ANDERSON) This is Exhibit 914. You know, I don't know that we even need to take the time to even get it out. I'm going to reference it. 914, I'll represent was the recommendations in December that the Department made. It was a one-page document. You are familiar with that; correct?
A. For the technical working group?

Q. Yes.
A. Yes, I am familiar with that. Yes.
Q. Yes. And that didn't recommend a move to transient; correct?
A. No, it did not.
Q. And if you need to look at it for reference, you can. But that's all I'm going to touch on it.
A. No, it did not.
Q. When did it first become evident to you, that the new methodology order, the Fifth Methodology Order was going to move to transient?
A. The official time is when the Director signed it.
Q. All right. Now, I understand that there may have been discussions. But when do you, for example, I assume you saw drafts of the order prior to it being signed and released?
A. Yes, correct.
Q. When did you first see a draft of the order that switched to transient?
A. The first draft of the order that I saw was sometime in late January. I can't remember if that draft had proposed language to move to transient. But at that time that the draft was given to technical staff, to Jennifer and Kara and I, so soon after. If it

didn't have it at that point, late January, it would have had it soon after. We were editing it actively at that point.

Q. And did you from your edits from that draft, did you add in the language regarding the move to transient?

A. No, that would have been Jennifer Sukow.

Q. Okay. But in a draft that you returned to the Director, did that have the language showing a move to transient?

A. Yes, there would have been -- I don't know the timing of it exactly, but it -- when we would have given him drafts that had that recommendation in it, or proposed language in it for that.

Q. Were you aware of any settlement negotiations going on between the Surface Water Coalition and ground water users at the time the Fifth Methodology Order was being prepared?

A. I don't remember if there were negotiations going on. I remember that there was some through the summer. And I thought they ended in the fall, but that's what I remember.

MR. FLETCHER: I'm going to object. I don't know the relevancy of that question to this proceeding.

THE HEARING OFFICER: Sustained.

Q. (BY MR. ANDERSON) I'm going to wrap it up here pretty soon. Can we go back to the methodology order, No. 300?

A. Okay. I have it.

Q. We're going to go to paragraph 30.

A. On page 13?

Q. Yes. I kind of want you just to walk me through a process, if you can. On paragraph 30, it references a Q sub D. How do you refer to that internally. Do you just say, "QD"?

A. We just call it diversions. But what it is discharge from diversions. The "Q" is discharge. And the "D" indicates it's from diversions.

Q. Okay. When you look at it, though, I appreciate your reference to calling it diversions. But it's actually a specific type of diversions; correct? You could look right above paragraph 30 if you --

A. It says above it, "QD" is defined as "irrigation entity diversion of water specifically put to beneficial use for the growing crops within the irrigation entity."

Q. So there is a slight difference in QD than just diversions; correct, or does the Department see no difference?

A. I think there is a difference. Here we are

referring to their entire diversions, the seepage loss, everything. What they diverted at their headgates.

Q. Okay. And that's how the Department sees QD is just diversions?

A. In the methodology?

Q. Yes.

A. Elsewhere? I don't know.

MR. ANDERSON: I don't think I have any further questions.

THE WITNESS: Okay.

THE HEARING OFFICER: Thank you, Mr. Anderson.

MR. ANDERSON: Thank you.

THE HEARING OFFICER: Further questions of Mr. Anders?

Mr. Harris.

CROSS-EXAMINATION

QUESTIONS BY MR. HARRIS:

Q. Mr. Anders, my name is Rob Harris. I represent the City of Idaho Falls. I don't think we've met before. But in the list that was read by Mr. Wood earlier. I understand that you are the person that the Department is designated to testify about the forecast supply; is that right?

A. You are correct.

Q. Okay. And you have in front of you Exhibit

300, which is the Fifth Methodology Order?
A. I do.
Q. Could you turn to page 18 for me?
A. What page?
Q. Page 18, paragraph 49?
A. Did you say, paragraph 49?
Q. Yes.
A. Okay. I'm there.
Q. Okay. As I understand the order when the Department or the Director looks at the forecast supply, he is looking at a prediction of the unregulated inflow volume at the Heise gage as of April 1st; is that right?
A. Yes.
Q. Okay. And that forecast is prepared by who?
A. We get that forecast from the Bureau of Reclamation, who does a joint -- what they call the joint forecast, with the Army Corps of Engineers.
Q. Okay. And Heise gage is generally located where on the Snake River; do you know?
A. It's located by Palisades. I don't know the exact mile, how many miles, but between Palisades and Idaho Falls generally speaking.
Q. So it's predicting the inflow in the watershed above that gage; correct?
A. The unregulated flow means if there were no

reservoir operations going on, how much would be there, so, yes.

Q. Are you familiar with some of the other watersheds of the tributary streams or basins in eastern Idaho?

A. A little familiar.

Q. Are you familiar with the Willow Creek drainage?

A. Somewhat.

Q. Okay. It's the drainage where Ririe Reservoir is located. How about the Blackfoot River drainage.

A. Not as familiar with that one.

Q. Okay.

A. But I know roughly where it is.

Q. The Blackfoot River comes below where the Heise gage would be; would you agree with that?

A. I believe it comes in from the east.

Q. The same with Willow Creek?

A. Yes, I believe my geography is right. They both come in from the east below Heise.

Q. Also the Portneuf River drainage; correct?

A. More familiar there. It comes in from the southeast, but also -- yes.

Q. And those are all tributary streams to the Snake River; correct?

A. I believe so, yes.
Q. And what is the source of the water right for the Twin Falls Canal Company; do you know?
A. The Snake River.
Q. The Snake River. And so these tributary basins come in above Twin Falls Canal Company's points of diversion; do you agree?
A. Yes.
Q. Okay. Are you familiar with the snow water equivalency maps that the Department posts routinely during the non-irrigation season?
A. Yes, I am.
Q. Okay. How are you familiar with those?
A. They are prepared by the NRCS. We take their data, and we create maps. And then we post it on our web page.
Q. And were you aware on the snow equivalency map for April 3rd, that the percentage snow pack in the Portneuf basin was 216 percent?
A. I knew it was very high. I didn't know the exact number.
Q. Did you know in the Blackfoot River drainage, it was at 186 percent?
A. Again, I knew it was high, not the exact number.

Q. The same for Willow Creek at 178 percent?
A. Again, I knew it was high, but not the exact number.
Q. Was there ever any discussion within the Department to look at these other basins, in addition to the unregulated flow at Heise, forecast as part of the water supply to the Surface Water Coalition?
A. We didn't have any discussions about adding them to our regressions or adding them some way to the joint forecast, no.
Q. But you would agree, it would provide water to the water supply of the Twin Falls Canal Company; correct?
A. Among others. They can supply water to the reservoirs. They can supply water to anybody below there that's in priority. But Twin Falls is among those water users.
Q. And the Portneuf River, for example, flows directly into American Falls Reservoir; correct?
A. Yeah, uh-huh.
Q. But that wasn't considered in the revised methodology order at all looking at anomalous snow pack situations and tributary basins?
A. No, we didn't do any review like that.
Q. In paragraph 49, there is also some discussion

about shifting one, was it one standard deviation in the forecast supply? Did I understand that correctly?

A. We calculate the supply. And then shift it down by one standard deviation, yes.

Q. Is that something that you recommended to be done?

A. That method was developed around 2014 or '15. My best guess is that was recommended by Liz Cresto.

Q. I'm sorry. Who is that?

A. Liz Cresto was formerly a hydrologist with IDWR, and she worked on the methodology. And her portion, or the portion she worked on was the forecast supply.

MR. HARRIS: I have no further questions. Thank you.

THE WITNESS: Thank you.

THE HEARING OFFICER: Thank you, Mr. Harris.

Further questions of Mr. Anders?

Mr. Budge.

CROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Thank you. Mr. Anders, I'm TJ Budge. I represent IGWA. Do you mind if I call you Matt today?

A. Sure, that would be great.

Q. All right. Matt, I want to follow up with

just some questions that Mr. Harris asked that piqued my curiosity. And maybe I didn't follow that. But I think I understood that the forecast supply, the joint forecast that goes into the forecast supply does not take into account inflows from the Portneuf or Blackfoot River basin?

A. That forecast is prepared by the Bureau of Reclamation and the Army Corps of Engineers. I'm not familiar with everything that they consider, or how they calculate it. But my understanding it's the flow, unregulated flow at Heise.

Q. Okay. So I want to ask a few follow-up questions. If that forecast doesn't take into account the Portneuf, or, you know, the Blackfoot River basins, is there anything else in the methodology that would account for the inflow from the Portneuf on a year like this?

A. I'm unsure what you mean by "account for."

Q. Are you aware that the Portneuf River basin had record snow pack this winter?

A. I knew it was high, yes.

Q. Yeah. And I'm from Pocatello, so this is, you know, close to home. But are you aware of the flooding that's been going on there for the last month or so?

A. I was not.

Q. Well, I'll just represent that the Portneuf had the highest snow water equivalent in Idaho this year. And it was record for the Portneuf basin. And there has been flooding for the last month in the lower Portneuf basin.

And so my question is, do you know if there is anything in the methodology order that would take into account that excess inflow on a year like this, that's coming in from the Portneuf?

A. We don't do an adjustment, or something on the forecast -- or on the joint forecast.

Q. Okay. And it's a genuine question, because I don't know that either. But I appreciate your answer. If there is no adjustment, then, you know, the record inflow or excess inflow would that become a windfall to the Surface Water Coalition or be accounted for in some other way?

MR. THOMPSON: I'll object to the form of the question.

THE HEARING OFFICER: Overruled.

THE WITNESS: I don't know about a windfall for Twin Falls Canal Company. It would be captured and delivered like any other tributary, or captured in the reservoirs. It would become part of the water supply. Who's going to benefit from that? It depends on which

reservoir is filling, what space is filling, who's in priority.

Q. (BY MR. BUDGE) Fair enough. Let me move back to the questions I had planned on asking you. But I appreciate that explanation. That's helpful. I will try not to duplicate questions that others have asked.

I understand that you have worked on prior versions of the methodology order?

A. I worked on the Third and the Fourth, yes.

Q. Okay. And then in respect to reviewing the Fourth and preparing the Fifth, you are the lead Department staff member overseeing the technical aspect of that review?

A. Yes.

Q. My understanding is that you took directions from the Director in terms of which analyses to perform. And then you would make those assignments to Jennifer Sukow and other staff members to perform those analyses?

A. Definitely took direction from the Director about what he wanted us to look at. When we started the review, I was not either directly or indirectly supervising Jennifer. I was supervising Kara.

Q. Okay. And your review began in the summer of 2021?

A. We started reviewing in 2020.

Q. 2020.
A. Fall of 2020, that check-in review on it, on the methodology.
Q. And that continued through 2021 and then into '22, until the Director's assignment in August of '22 that he was going to proceed with amending the methodology order?
A. Not continuous. We worked for a few months reviewing it, and presenting our results to the Director between maybe October and February -- October 2020 and February 2021. And then we, Kara and I may have been working a little bit on our own, individually.
But there was no formal kind of check-in review going on, until fall of 2022, or I should say, late summer, when we started talking about it again. We had been talking about it on and off in there, but that's when in August, that's when the Director issued we needed to convene the technical working group.
Q. What components of the methodology did you work on in the fall of 2020, and then into the winter of 2021?
A. Originally we were looking at baseline year, we were looking at forecast supply, and we were looking at near real-time metric.
Q. And I understand that a main impetus for

reviewing the Fourth Methodology Order was just the passage of time, and additional data that had been developed since 2016?

A. That was part of it. We were also -- one of the variables that we used for forecast supply is Box Canyon at after -- we issued the Third Methodology Order in 2015. And then the USGS did a shift on that gage that spring. And we were unsure about what that did to our regression that we were using for forecast. So we have been -- we had been watching that on and off for years.

In 2020, we became concerned again about is Box Canyon performing the way we want it to? And then the passage of time on the baseline year, was that still meeting all the criteria?

Q. And Box Canyon is part of the regression equation used to predict forecast supplying?

A. It is. Not for all the companies, but specifically it is for Twin Falls Canal Company, which is the one that has the first shortfall. So we watch that closely.

Q. Okay. And the deterioration in that regression equation in the R-squared value was one of the impetuses for reviewing the Fourth Methodology Order then?

A. Yes, that's an indicator of, is the regression performing the way we want it to be?

Q. Okay. So there wasn't some type of emergency circumstance that forced the Department to review the Fourth Methodology Order?

A. Not that I remember.

Q. Okay. You participated in the August 5th, 2022 status conference, where the Director announced publicly that the Department was going to review the Fourth Methodology Order?

A. Yes, I was present.

Q. And do you recall from that, that I raised a concern about how this proceeding would comply with due process?

A. I remember you talking. I don't remember what you said.

Q. It must not have been that memorable.

A. Sorry.

Q. Are you aware that there was subsequent correspondence between myself and Garrick Baxter about holding a hearing, and complying with due process in the Administrative Procedures Act?

A. No, I'm not aware.

Q. Was there any discussion among technical staff as to whether the Department would hold a hearing before

or after issuing the Fifth Methodology Order?

A. Say that again. Please repeat that question?

Q. Yeah. Was there any discussion among the Department staff, about whether the Department would hold a hearing before or after issuing the Fifth Methodology Order?

A. I hate to do this again. When you say "hearing," were you talking about on the Fifth Methodology Order, or were you still talking about the August 5th? I'm confused which one you are talking about. A hearing for each one?

Q. I apologize for not asking clear questions. So the hearing we're holding today on the Fifth Methodology Order. Was there ever any discussion as to whether an evidentiary hearing would be held before, versus after the Fifth Methodology Order was issued?

A. Not with me.

Q. Okay. Let me ask you to turn to Exhibit 914. In fact, you don't need to turn to it. This is the preliminary recommendation document that you and Kara Ferguson authored?

A. Yes.

Q. You are very familiar with that.

A. Yes.

Q. That document is titled a recommendation

concerning the Fifth Methodology Order. Ultimately, was that a recommendation to the Director?

A. Yeah, I believe that is. It's from Kara and I to the Director.

Q. Okay. And did the Director contribute to reviewing and editing that recommendation before it was published?

A. Yes.

Q. That's dated, I think, was it December 23rd? What's the date on that?

A. That sounds familiar. It was right before Christmas. Yeah.

Q. And that followed the technical working group presentations that were made in November and December; correct?

A. Yeah. I think the last technical working group meeting was about a week before that.

Q. Okay. So as of the time of that recommendation, all of the technical presentations to outside consultants had been completed?

A. Yes.

Q. And we heard Jennifer this morning testify that she didn't really do any modeling related to the Fifth Methodology Order, you know, after our technical presentation was made; is that correct?

A. I don't know.
Q. Okay. Had the technical review of the Fourth Methodology Order essentially been complete by the time you issued the December 23rd recommendation document?
A. I would call the preliminary was complete. That's what I would call that. There was additional review. And as we were drafting the order, talking about different aspects of it, and things changed. So I would say that's more of kind of like the preliminary portion was done.
Q. Was the subsequent review a discussion of the technical work that was presented in November or December, or did the Department continue to perform additional analyses that, you know, had not been presented in November, December?
A. I don't think there were -- there were additional analyses that we worked on after the technical working group.
Q. What did those consist of?
A. The ones that I remember the most, were centered around reasonable carryover. When we presented that to the technical working group, we actually realized about halfway through the technical working group, that we hadn't planned on modifying reasonable carryover. But then we realized, or I realized that the

baseline year is part of that calculation. So that we were going to have to take a look at reasonable carryover.

And we -- that was during the technical working group. So the way that I presented it there was, if we just inserted the 2018 baseline year in the reasonable carryover calculation. Here's what you -- here's the results. And here would be the impact on how often we would have a reasonable carryover shortfall.

After we got the comments, and after we were into the drafting, we started doing additional analyses looking at the reasonable carryover.

Q. Okay. Was there an updated PowerPoint presentation or some other type of report that reflected the additional carryover review that you conducted?

A. No, we did not send anything out.

Q. Okay. Was there something generated internally within the Department, or was it more just verbal discussions?

A. There were several meetings. There were proposed drafts, or proposed language in the order, conversations about it. And then ultimately, what our final decision is in the order.

Q. Understood. Any other components of the

methodology that you continued to conduct additional analyses on after December 23rd?

A. I can't remember the date on the email. Kara sent -- Kara Ferguson sent out some additional analysis about kind of follow up for additional variables on the forecast supply. I want to say that came out late December, after that summary.

Q. Okay.

A. But that was to the technical working group, mailed out to everybody.

Q. So that email went to the folks that were invited to those November, December technical working group --

A. Correct. Everybody that was on our list that we sent everything to, that would have gone out to all of those.

Q. Okay.

A. I can't remember the date on it, but I think it was after the 23rd, when that went out.

Q. Okay. So other than the email that you just mentioned that Kara sent out, and the additional carryover analysis. All the other technical work had essentially been completed by the end of 2022?

A. I think on irrigated acres, based on input from the technical working group, I calculated -- I

think I did some additional work on the irrigated acres to calculate what they would be, with the new shapefiles, and like the 2023 shapefiles. So I had to do some additional work there. I also worked on Milner, which is why we released that one.

Q. Got you. When you say the 2023 acres, is that based on the acreage that the Coalition reported in 2023 under Step 1 of the methodology?

A. Yeah.

Q. Okay.

A. We received a new shapefile. And I -- for Minidoka. And I recalculated the acres for Milner.

Q. Okay. And Twin Falls Canal reported the same acreage in '23 as they have since 2013; correct?

A. They sent us a letter. I don't remember if the acreage is in that letter, or if they just say it hasn't changed five percent from our previous year. I'm not sure of that.

Q. Okay. You didn't go run the methodology based on the other acreage figures for Twin Falls that were discussed earlier today? And what I mean by that, I'll clarify. Is in the technical working group presentation where it shows the irrigated lands, dataset acres, and the metric acres that were around 179,000 or 180,000. You didn't run the methodology based on those acreage

figures?
A. No, I used the 194 number for the methodology.
Q. Okay. Thank you.
(Exhibits 915 and 916 marked.)
Q. (BY MR. BUDGE) Let me have you open the common exhibits binder, and turn to Exhibits 915 and 916.
A. So, yep, I'm on 915.
Q. And is 915, the comments that Sophia Sigstedt with Lynker Technology submitted to the technical working group, I think that was January 16th?
A. Yeah, they are from Heidi Netter and Greg Sullivan, 915.
Q. I've got those backwards. So 915 are the comments from Spronk Water Engineers?
A. That's what I have.
Q. Okay.
A. Yep.
Q. And then 916 are the comments from Sophie Sigstedt with Lynker Technology?
A. Yep, that's true.
Q. Are you familiar with those documents?
A. Yes, I am.
Q. Just describe briefly what those are?
A. So these are the comments provided. 915 is

the comments by Spronk Water Engineers related to the information that we presented in the technical working group and the summary. And the same is true for 916, but this one is from Sophia Sigstedt of Lynker Technology.

Q. Thank you. And these comments were solicited by Department staff as part of the technical working group process?

A. Yeah, they were.

Q. And they were kept by the Department, among its records, considered in connection with developing the Fifth Methodology Order?

A. Yes, we reviewed them in our process.

MR. BUDGE: I would move to admit Exhibits 915 and 916.

THE HEARING OFFICER: Any objection to the admission of these documents?

With no objection -- well, it seems odd to me that they are coming in through Mr. Anders, and not the experts, themselves, who will testify. But they are the documents marked as Exhibits 915 and 916 are received into evidence.

(Exhibits 915 and 916 received into evidence.)

Q. (BY MR. BUDGE) Matt, did you review those documents when they came in?

A. Yes.
Q. And did you communicate those to the Director, and bring to his attention the issues raised in those documents?
A. Yeah, we did.
Q. Let me shift gears back to a discussion we had a moment ago about forecast supply. And we talked about the degradation of the regression equation used for Twin Falls Canal Company.
My understanding is that the forecast supply for Twin Falls Canal was based on a regression analysis comparing natural flow of the Snake River near Heise to the natural flow diverted by each Surface Water Coalition entity; is that accurate?
A. I think there is an additional variable there, predictor. I think it's Box Canyon. I would have to look at the -- for Twin Falls Canal Company, I would have to look at the order to make sure.
Q. Okay. Can you just summarize their regression equation as you understand it, utilized to predict Twin Falls Canal Company's forecast supply?
A. I think it's the unregulated flow at Heise. And I think November through March flow at Box Canyon is the other variable.
Q. Okay. And you mentioned that one of the

reasons that the Department undertook a review of the Fourth Methodology Order is due to concerns with the reliability of that predictive tool?

A. Yes. Is that tool, or is that regression accurate still.

(Exhibit 103 marked.)

Q. (BY MR. BUDGE) Okay. If you'll turn to Exhibit 103. That's in one of the binders of IGWA's exhibits.

A. 103 for me is the 2015 technical memo from Liz Cresto and I, to the Director.

Q. That's correct. Thank you. I'm sure you recognize this document, since you are one of the authors?

A. Yep, I recognize it.

Q. Just explain briefly what this document is?

A. So in two-thousand- -- I think all the meetings were in 2015. We held a series of technical working group meetings with the consultants and representatives of the parties. And we talked about several topics. And based on those, or kind of that -- those meetings, Liz and I wrote this technical memo to the Director.

In addition to this technical memo, I think attached to it, were comments if the consultants of the

different parties wanted to submit comments, that we attached them to this. And I believe they all did. I can't remember.

Q. I believe they may be attached.

A. Yes.

Q. Okay.

A. I see them attached here.

Q. If I look at the introductory paragraph at the bottom of that, it identifies three specific issues that the Director had tasked Department staff with evaluating. And Issue No. 1 is "Revising the natural flow forecast methods for Twin Falls Canal Company."

Can you explain what was going on at that time, and why Department staff had been tasked with analyzing this?

A. I don't remember exactly why we were tasked with that. But in the fall of 2014, we received a court ruling that listed several things that we had to adjust or look at in the methodology. This may have been one of them.

Q. Okay.

A. I don't remember.

Q. So does the simple fact that that action item was being assigned for review and improvement, indicate that there were some concerns with the reliability of

the natural forecast methods that had been used at that time?

A. I'm not sure. But I would expect that there was some concern with the way we were doing it.

Q. But you don't remember whether there was concerns with that at that time or not?

A. I don't at that time.

Q. Okay. Has the Department had concerns with Twin Falls' forecast regression for some time now?

A. We've been concerned about it, I'll speak, since 2015, since we issued the Third Methodology Order. We've been concerned and monitoring that forecast. We're seeing a degradation or a downward decline in the R-squared for that one.

(Exhibit 901 marked.)

Q. (BY MR. BUDGE) Let me have you turn next to Exhibit 901.

A. Okay. I have that, 901.

Q. So I'll read the title "Evaluation of Method for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover: April and July Forecast Supply," presented by Kara Ferguson, dated November 17th, 2022. Is that the one you are looking at?

A. I am.

Q. Do you recognize that document?
A. Yep, I do.
Q. Is that a copy of the presentation that Ms. Ferguson gave to the technical working group this last November of 2022?
A. I didn't memorize the presentation, but it does look like the slides that she gave.
Q. Okay. If you'll turn to page 9 of that exhibit?
A. Yep, the page number at the top, Exhibit 901, page 9.
Q. I'm going to bookmark that just for a moment.
MR. BUDGE: Director, I'm going to take a step back and move to admit Exhibit 103, which is the 2015 staff memo we discussed a moment ago.
THE HEARING OFFICER: Any objection?
Hearing no objection, the document marked as Exhibit 901; is that correct, Mr. Budge?
MR. BUDGE: 103.
THE HEARING OFFICER: I'm sorry. 103. Wait a minute.
MR. BUDGE: We're on 901 currently. But I'm stepping to the prior exhibit. I failed to move for its admission while we were discussing it.
THE HEARING OFFICER: Okay. Let me work

through that again. So you've moved for admission of document marked as Exhibit 103. Any objection?

Hearing no objection, the document marked as Exhibit 103 is received into evidence.

(Exhibit 103 received into evidence.)

MR. BUDGE: Okay. Thank you.

Q. (BY MR. BUDGE) And, Matt, thanks for the detour there.

Let's go back to Exhibit 901. If you could flip to page 9 of that exhibit?

A. Yep, I'm there.

Q. Are you familiar with this page of the exhibit?

A. Yes, I am.

Q. And can you explain what that table on page 9 shows?

A. So the top half of that slide talks about how we -- what the multi-linear regression that we're using for AFRD2, BID, Minidoka, North Side, Twin Falls Canal Company, and then it provides the equation.

And then the table at the bottom is by each one of those members, it's showing what the adjusted R-square value was in 2014 when we established it, or 2015. I think the order was signed in 2015. And then it shows the progression of the R-squared for each one

of those, in 2016, 2018, 2020, and 2022.

Q. And can you explain the significance of an R-squared value, what that term refers to?

A. It is a statistic that's calculated with regressions that help users understand how much of the variability that regression equation is accounting for. Generally speaking, the ranges between one and negative one. As you get closer to one or negative one, that's a better value. So in this case the higher values, the higher decimal values that you see here are a better result.

Q. And when you say "better," it means that the regression equation is more accurately predicting supply, the higher the number?

A. Yeah, generally speaking, yes.

Q. And we can see that for the first for SWC members, AFRD2, BID, Minidoka and North Side Canal Company, the R-squared value has remained relatively constant. But for Twin Falls it has declined over time. Do you see that?

A. I do see that.

Q. You testified earlier that the Department has had some concerns about the regression equation for Twin Falls Canal. Is this representative of the Department's concern?

A. Yes, this is it. The reduction in that number from 2014 to 2022 is our concern.

Q. And you testified that the Department started in 2020 to begin looking at certain components of the methodology. Is this one of the components that you started reviewing early on?

A. Yes, this is one of the first ones we were looking at, forecast supply. Specifically Box Canyon was, but we looked at other things. But we were for sure looking at Box Canyon.

Q. Okay. Explain why you were looking at Box Canyon?

A. We, as I said earlier, we developed the regressions -- Liz Cresto developed these regressions in 2014 and 2015. And then we issued the order in April. And then there was a shift on that gage at Box Canyon. And we were unsure what that meant. We had developed the regressions before that. We were unsure what that meant to our regressions now. Are we going to accurately predict. So that was the first. It's been in our minds since then about, did something change? Can we rely on the regressions that we built? So we had that concern since right away, since day one almost after we issued the order.

Q. So Box Canyon may be one of the contributing

factors that's causing the degradation in the R-squared?

A. It could be, yes.

Q. Do you have any other ideas what might be contributing to that?

A. The only other variable is Heise, and it's working for the other companies. Maybe for some reason, it's not working for Twin Falls. But it seems like it's Box Canyon.

Q. Okay. Is it possible that the model, itself, for Twin Falls Canal just needs to be changed?

A. It's possible. And we would consider if we could find another predictor variable that works better that we would change it.

Q. Okay. Has the Department evaluated alternative models for Twin Falls?

A. At this point, our recommendation was that we would keep watching it, and see if it continues to degrade. So we've done -- I think Kara did three, maybe three variables looking at possible alternatives. But nothing extensive at this point.

Q. Okay. Let me have you turn to Exhibit 916, which you might still have in front of you. We reviewed that one earlier today.

A. The Lynker comments?

Q. Yes.

A. From Sophia?
Q. Yes.
A. Okay.
Q. If you turn to page 4 of that exhibit, I think it's --
MR. FLETCHER: Did you say 915.
MR. BUDGE: 916.
MR. FLETCHER: Thank you.
Q. (BY MR. BUDGE) It's that top paragraph, No. 2.
A. Yep, I see it.
Q. Okay. That's not the paragraph, actually. Under the heading "Section 2: Forecasting Natural Flow Supply." You've read this document, Matt?
A. Yes.
Q. You may remember that in the second paragraph underneath that heading, "Section 2," and you can review it, it's in front of you. That Lynker Technology or Sophia Sigstedt had proposed an alternative recommendation in 2015, a different approach to modeling forecast supply for Twin Falls Canal.
Are you familiar with this part of Sophie's report?
A. Yes, I am familiar that that's what she's stated, yes.

Q. Did you recall that Sophia had made an alternative proposal in 2015?
A. I did not remember that proposal.
Q. Okay. Do you know if the Department has done any work to evaluate the proposal that Sophia suggested in 2015?
A. Not to this point that I know of.
Q. Okay. Do you recall advising the Director that Sophia had proposed an alternative mechanism to forecast supply for Twin Falls?
A. I don't think I passed that recommendation along to the Director.
Q. Matt, let me have you turn to Exhibit 300, which is the Fourth Methodology Order?
A. Okay. I'm there.
Q. And then turn to page 9.
A. Okay. I'm on page 9.
Q. If you look down to paragraph 19, it's under a heading "Irrigation Practices." And the sentence in that paragraph states that, "Current condition should be represented by: (a) the net area of the irrigated crops." And then I'm not going to read B and C.
A. Okay.
Q. But in terms of net area of irrigated crops, do you understand that to mean that current conditions

should represent actual irrigated acreage?
A. I think that's what "net" means there, the irrigated acres.
Q. Okay. And you've been asked a number of questions earlier about different irrigated land datasets. The 2011 irrigated lands dataset, the 2017, near real-time metric dataset, and then there was an analysis done by SPF water engineers in 2009. You are familiar with those different acreage representations?
A. Yep.
Q. And for Twin Falls Canal Company each of those analyses showed actual irrigated acres around 180,000 acres total?
A. More or less, somewhere --
Q. More or less?
A. -- between 180, 179, 183, somewhere in that range.
Q. Right in there?
A. Yes.
Q. After the 2017 irrigated lands dataset came out -- well, let me back up. Can you explain how irrigated acreage is utilized in the model to predict reasonable in-season demand?
A. Yes. So --
Q. Let me clarify. I said used in the model. I

meant used in the methodology.

A. Okay. That's what I was going to answer anyway. So when we calculate crop water need, the equation is we take the ET, and we subtract off the effective precipitation. And then we take the ET by crop type, and multiply it by the acres of each crop type that we have calculated with the crop mix.

Q. Okay.

A. And then -- go ahead.

And then with the crop water need, we divide that by project efficiency, and that becomes the reasonable in-season demand on a monthly basis.

Q. So if irrigated acreage goes up, the demand prediction goes up. And if irrigated acres goes down, the demand prediction goes down?

A. If crop water need -- I guess if the ET and everything else is held constant, that is true.

Q. Okay. After the 2017 irrigated lands dataset came out, and that one showed for Twin Falls Canal 180,956 acres. Did the Department approach Twin Falls Canal Company and ask them to justify the higher number that they had been reporting, the 194,000 acre number?

A. Not that I know of.

Q. After the 2021 near real-time metric dataset came out that also showed around 179,000 acres

irrigated, do you know if the Department approached Twin Falls at that point and asked them to justify their higher figure?

A. Not that I know of.

Q. The 194,000 acre-foot figure acre figure the Twin Falls Canal Company reports, that's based on 2013 shapefile, I believe; is that right?

A. Yes, they submitted us a shapefile. We do some GIS analysis on it to remove overlaps or anything outside the service area.

Q. Okay. On that shapefile you said you remove overlaps. Can you explain what that consists of?

A. If there is two polygons in a shapefile that overlap, those acres will be double counted.

Q. Okay. Did the Department take that 2013 shapefile, and also remove hardened acres from that shapefile?

A. No.

Q. Okay. The 2017 irrigated lands dataset, I understood from Jennifer Sukow's testimony, that it does go kind of field by field and removes hardened acres; is that correct?

A. That dataset has three classifications in it. In the irrigated, it takes out any hardened acres. That's usually just fields. But the semi-irrigated will

have, as Jennifer explained, will have farmsteads, or maybe a subdivision, where there are a mixture of hardened acres and irrigated acres in there.

Q. As of 2017, is it your view that that 2017 irrigated lands dataset would have been more accurate than the 2013 shapefile?

A. Can you restate the question?

Q. Yes. Once the 2017 irrigated lands dataset was completed, at that time do you agree that it would have provided a more accurate representation of irrigated acres than the 2013 shapefile?

A. I think so, yes.

Q. And I understand that a metric dataset was completed in 2017; is that correct?

A. I'm not sure what you mean by a metric dataset?

Q. Excuse me. 2021.

A. When I saw that on -- I don't know where I saw that -- on a table that came in or something. I think what that is, is when we were doing the real-time metric, we were removing the irrigated acres -- or the non-irrigated acres, using the 2011 irrigated lands dataset for consistency.

I think that's where that number comes from. It wasn't generated by near real-time metric. It was us

in our processing removing the acres. And what was left may have been reported by as 2021 acres in the technical working group. But it was actually, I'm pretty sure, it was done with the 2011 irrigated lands dataset.

Q. Okay. Let me have you turn to Exhibit 325.

THE HEARING OFFICER: Mr. Budge, how much longer do you have with Mr. Anders? I think I need to call for a break here. We've been at this probably --

MR. BUDGE: I've got probably a half an hour. And I don't mind taking a break.

THE HEARING OFFICER: All right. Let's take a break for 15 minutes. And come back at 3:40.

(Recess.)

THE HEARING OFFICER: Let's start.

MR. BUDGE: Back on the record.

Q. (BY MR. BUDGE) Okay. Matt, let's shift gears. And let me have you turn to Exhibit 300, which is the Fifth Methodology Order. And when you get there, you can turn to page 10.

A. Okay. I'm on page 10.

Q. If you look at paragraph 23, that's a finding of fact in the methodology order that deals with supplemental ground water use. Are you familiar with that paragraph?

A. Yes, I am.

Q. The second sentence, and I'll read that. It says, "Supplemental ground water is a factor the Director can consider in the context of a delivery call." It then cites a district court decision. And then it says, "At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities."

During the Department's technical review of the Fourth Methodology Order, was any effort made to evaluate supplemental ground water use?

A. No.

Q. The Department does have a database of all surface water and ground water rights; correct?

A. Yes, we do.

Q. And the Department has a WMIS database that keeps track of all ground water diversions and surface water diversions?

A. I don't think that database has all ground water diversions. I believe it just has the ground water diversions that have some kind of measurement order on them that require them to be measured.

Q. Okay. I appreciate the clarification. So there are some, you know, small domestic rights and other comparatively small water rights that aren't being

measured and reported in WMIS?

A. Yes.

Q. But in terms of irrigation rights, any irrigation right larger than five acres essentially is being reported in WMIS; correct?

A. I don't believe all irrigation rights in Idaho, ground water irrigation rights greater than five acres are in that database. I think they have to have a measurement order or something to get them in that database.

Q. The water rights on the -- the ground water rights from the ESPA within the area of common ground water supply, do you understand that they do have a measurement order?

A. Yes.

Q. Okay. So the ground water rights that are affected by this delivery call, their diversions would be in the WMIS database?

A. I believe they are.

Q. Okay. Could the Department utilize place of use shapefiles, water right conditions, and diversion data to analyze supplemental ground water use within the Surface Water Coalition entities?

A. I think that you could start the analysis with those pieces of data, the water rights, and the WMIS I

pumping data. I don't think you can get all the way to clear and convincing with those two pieces of data.

Q. What else would you need?

A. Those -- I think you need to talk to the individual water users or some fraction of them to try to get an idea of how they are using the water. Some of those systems are complicated. They have well water in with surface water shares. You have to understand the system about where the water is being applied, and when it's being applied. And I don't think you can get that without talking to the users, at least on some level.

Q. Yeah. So the Department does have the metric database that's calculating ET?

A. Yes.

Q. And we do have surface and ground water delivery records. So between irrigated acreage, ET, surface water and ground water deliveries, is it not possible to calculate, at least to the extent we're able, the supplemental ground water use?

A. We don't know where the shares are going inside the service areas, you know, for the companies, where they are applying the water. I think, yeah, I don't think you can get the clear and convincing without talking to the users just on a remote sensing type of analysis.

Q. Well, I'm not asking about legal standards --
A. Okay.
Q. -- clear and convincing evidence. So disregard what the legal standard is?
A. Okay.
Q. I'm just saying, technically does the Department have a way to do that? Because we heard Jennifer Sukow say that, yes, they do that in the model?
A. In the model, they have a dataset that they are using.
Q. Okay. Could we use that same dataset in the methodology order?
A. Theoretically, we could.
Q. Okay. If that's all we've got, that's the best we've got, could we use that?
A. When I say "theoretically" we could use that dataset. I don't think that dataset achieves or meets the clear and convincing, again.
Q. Okay. But --
A. You've told me not to do that.
Q. -- setting that aside. I'm just asking technically, is that the best data you've got today?
A. That dataset is -- my understanding of that dataset was, it was originally created before the SRBA, based on water rights. And at that time, IDWR was

tracking surface and ground water on the water rights. That's a very old dataset. We haven't updated it since. So theoretically we could use that dataset. It may be the best dataset we have. It's not the best dataset.

Q. Yeah. I'm going to think of it kind of like the R-squared for Twin Falls. It's not that great. But it might be the best thing we've got. Is that a fair analogy?

A. Those are such vastly different datasets. When you say that for Twin Falls Canal Company for that regression, we have been working on that. We have been updating that. You are talking about a very old dataset here in my mind. Perhaps those might be the best dataset we have.

Q. Okay. Because the methodology does not account for supplemental -- actually, let me strike that question. I'm going to take a step back.

You are aware that many of lands within the surface water entities do have supplemental ground water rights?

A. I do know they do have supplemental ground water rights. How many? I don't know.

Q. But we know there is ground water being used to irrigate some the lands within the surface water entities; right?

A. I think there are likely lands that are ground water only within the Surface Water Coalition service areas. And what we would call a supplemental, where there is surface water and ground water used on the same land. Yeah, I think they are in there.

Q. And so when the methodology order does not take into account supplemental ground water use, the effect of that is an assumption that all of the land within each Surface Water Coalition entity, is irrigated solely with surface water; correct?

A. Yeah, that is the way that we're doing that.

Q. And if in reality there is ground water being used to irrigate some of those lands, then by not taking into account supplemental ground water use, the methodology effectively overstates surface water demand within the Surface Water Coalition entities?

A. I think so. It would over calculate, yes.

(Exhibit 928 marked.)

Q. (BY MR. BUDGE) Okay. Let me turn your attention next to Exhibit 928. Matt, I'm actually going to change numbers on you. Let's go to 907.

A. Okay. I have that presentation.

Q. I apologize for the delay. I'm not pulling up the slide that I expected. I've got a typo in my notes. That was a mistake on my part.

I am going to go back to Exhibit 928. This is a PowerPoint presentation. It is titled "Proposed Modification and Method for Determining Reasonable In-Season Demand for Surface Water Coalition Use of the Real-Time Metric," by Ethan Geisler, Kara Ferguson, and Matt Anders, dated December 1st, 2022.

Is that what you are looking at, Matt?

A. I am.

Q. Do you recognize this as one of the working group presentations given last December?

A. Yes.

Q. Why don't you flip to the last slide, Slide No. 22. It's labeled "SWC Methodology Acres." And it lists what I understand are the number of acres utilized for each Surface Water Coalition member in the methodology order.

A. Yep, I'm on page 22.

Q. And is that what that slide reflects?

A. Yes, for the 2022 irrigation season.

Q. Okay. And under "SWC Member," A & B, there is an asterisk. And then there are some notes down at the bottom it says asterisk "A & B acres include," and there is a "1-14, 14,637 acres." Can you explain what that refers to?

A. That is -- so this bullet is our notes, are my

notes about how we got the irrigated acres for A & B. So the first bullet under "A & B acres include:" 1-14 is the water right. And the 14,637 is the number of acres.

Q. So A & B owns water right number 1-14. And that water right authorizes the irrigation of 14,637 acres?

A. Yes.

Q. And then in the table, it shows that the methodology order is using 15,924 acres. Do your other notes explain the difference there?

A. Yes. So the second bullet, it's "beneficial use claims," and then it lists the series of water rights there. And then the number of acres for those. And then the final bullet is enlargement. It lists two water rights, and then 1175.2 for acres. So A & B if you add those three numbers together, they should -- the 14,637, the 111, and the 1,175, it should total up to 15,924 in the upper table.

Q. Do you know what priority rights are in the beneficial use claims in the enlargement water rights?

A. I do not.

Q. Are you familiar with enlargement water rights generally?

A. Very, very generally.

Q. Okay. I'll just represent that enlargement rights have an effective priority date of 1994, which is junior to probably all of the ground water rights that are at risk of curtailment under the methodology order.

And so my next question is, has there been discussion within the Department staff as to whether the methodology should be run based on the 14,637 acre figure instead of the 15,924 acre figure?

A. No, we haven't had any discussions about that.

Q. Okay. If, as I represented, the enlargement rights are junior to the ground water rights of IGWA and others, do you agree that it would probably be important or appropriate to make that adjustment, and run the methodology based on the 14,637 acre figure?

A. I don't know. I would have to investigate it further.

Q. Okay. Fair enough. Let me ask a few follow-up questions about the Director's move from the steady state to a transient state model. Are you aware of the settlement agreement between IGWA and the Surface Water Coalition related to the Coalition's delivery call?

A. Yes, I'm aware of it.

Q. Are you aware that there is an ongoing dispute between them concerning the breach of that agreement?

A. Also aware of that, yes.
Q. Did that ever come up in your discussions concerning the Fifth Methodology Order?
A. No, not that I remember.
Q. Okay. Are you aware that IGWA and the Coalition were involved in settlement negotiations this last February?
MR. FLETCHER: Director, I'm going to object, again, to the same line of questioning I objected to earlier. I'm not sure whether this is relevant.
THE HEARING OFFICER: Sustained.
Q. (BY MR. BUDGE) Matt, let me ask, I've just got a few more questions. I'm almost done. So I appreciate your patience.
Is it your understanding, Matt, that the change in the baseline year from the Fourth Methodology to the Fifth Methodology would result in much larger and more frequent demand shortfall predictions?
A. In April.
Q. In April?
A. It will increase the shortfall predictions.
Q. Okay.
A. In July, we also use the baseline year. So it will likely increase July, not for certain. But it will likely do that as well.

Q. Okay. And then as the demand shortfall becomes larger and more frequent, that translates into larger and more frequent curtailments of junior ground water rights in the absence of mitigation?

A. In April and July.

Q. In April and July?

A. Yes.

Q. And you understood that when you change from a steady state to transient state curtailment, you end up with exponentially more acres being curtailed under the Fifth Methodology Order than what have occurred under the Fourth?

A. I don't know about exponentially. But it is a larger acreage that's curtailed.

(Exhibit 929 marked.)

Q. (BY MR. BUDGE) Okay. Let me have you turn to the Conjunctive Management Rules, and that's Exhibit 929.

A. Okay. I have the rules.

Q. Are you familiar with the Conjunctive Management Rules?

A. Generally.

Q. If you'll scroll down to, I believe, it's page 4, Rule 20. I'll just give you a moment to read rules 20.03 and Rule 20.04.

A. Did you say page 4?
MR. WOOD: Page 5.
Q. (BY MR. BUDGE) It's page 5. My mistake.
A. Page 5. I'm sorry?
Q. Yes.
A. Okay.
Q. Yes, just take a moment to refresh your memory as to 20.03 and 20.04.
A. Okay.
Q. At the bottom of 20.03, there is a statement, "An appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water as described in this rule."
Are you familiar with that concept?
A. A little bit familiar.
Q. Okay. Looking in 20.04, there is a reference to the futile call doctrine. The second sentence says, "The principle of the futile call applies to the distribution of water under these rules."
Are you familiar with the futile call doctrine?
A. Yes, I am.
Q. Okay. And then next I'm going to have you

scroll down to Rule 40.03. It's on page 9.

A. "Reasonable Exercise of Rights."

Q. Yeah. Go ahead and review that?

A. (Witness complying.) Okay.

Q. And so just to summarize 40.03, just explains that the Director will consider reasonable use of water under Conjunctive Management Rules. And so my question, were the concepts we just reviewed, were these ever brought up in connection with the technical work that you did in connection with the Fifth Methodology Order or the As-Applied Order?

A. Not that I remember.

Q. There wasn't any discussion of how -- let me strike that question.

You weren't given any instructions from the Director to perform technical analyses related to those concepts?

A. No, I was not.

Q. Are you familiar with how the Department applies the futile call doctrine in surface water systems?

A. Yes, I am.

Q. Can you just explain briefly how that's applied?

A. If a water user makes, in my layman's terms,

if a water user makes a water call, if the water cannot be delivered to that user, it's considered futile, and the call is not honored or made.

Q. Okay. Have you been involved just personally, in water distribution where the futile call doctrine is applied in Idaho?

A. I don't know if they apply it. But the closest would be in the Big Lost for the water righted county. They argue every year about, can we get water down below the Darlington Sinks. I don't know if they use the futile call. But they are always talking about it.

Q. Okay. Do you know if there is any like time parameters that are utilized in the Big Lost to evaluate whether a call is futile or not?

A. I don't remember off the top of my head if they use a parameter.

Q. Okay. Who within the Department would be most qualified to testify as to that?

MR. THOMPSON: I guess I'll lodge an objection here, Director. I guess the surface water administration around the state, and how futile call is applied to specific basins, I think is irrelevant to this proceeding.

THE HEARING OFFICER: I'll overrule the

objection.

But, Mr. Budge, I wonder about the relevance of the question. But I'll ask Mr. Anders to answer it.

THE WITNESS: Probably somebody in the water compliance Bureau. They deal with watermasters, and rules, futile calls, things like that.

Q. (BY MR. BUDGE) Okay. And, Director, I only have a couple questions on this topic.

Are you familiar with the application of the futile call doctrine in the Teton River basin?

A. I am not.

Q. Okay. Would Tony Olenichak be most suited to explain how it works in that context?

A. If it's in Water District 1, he would be the person to talk to as the watermaster.

Q. Okay. That's all the questions I have in that regard. Just a few more questions.

Has the Department conducted any analysis of just the long-term effects of the beneficial use of water from the ESPA as a result of the changes made in the Fifth Methodology Order?

A. No.

Q. Has the Department attempted to quantify the additional beneficial use that would occur within members of the Surface Water Coalition as a result of

changes made in the methodology order?

A. Not that I know of.

Q. Are you familiar with the concept of a trimline that's been used in other delivery calls?

A. I've heard of the trimline, yes.

Q. Okay. What's your understanding of the concept?

A. It is a geographic area used in modeling.

Q. Did that term ever come up in connection with your work on the Fifth Methodology Order?

A. No.

Q. So to your knowledge, none of the Department technical staff asked if there should be some evaluation of trimlines?

A. It's related to modeling. I don't remember any conversations, but I am not involved in all of the conversations related to modeling.

MR. BUDGE: Okay. That's all the questions I have. Thank you, Matt.

THE WITNESS: Thank you.

THE HEARING OFFICER: Thank you, Mr. Budge.

Further questions from the ground water group? Mr. Bromley.

MS. McHUGH: Yes. Oh, is Mr. Bromley going to do it?

THE HEARING OFFICER: Mr. Bromley is standing halfway to the podium.

MS. McHUGH: Okay.

THE HEARING OFFICER: I could ask Mr. Bromley if he wants to yield.

MR. BROMLEY: I've got to take a shot, Director.

THE HEARING OFFICER: Okay.

CROSS-EXAMINATION

QUESTIONS BY MR. BROMLEY:

Q. Hi, Chris Bromley on behalf of the Coalition of the Cities. Matt, I just have a couple questions here.

So Exhibit 300, which is the Fifth Methodology Order, if you could turn to that?

A. Yes.

Q. And let's look at page 18.

A. Did you say 18?

Q. Yes, I did.

A. Okay. I'm on page 18.

Q. Great. And we've got paragraphs 49 and 50. And when I look at paragraph 49, it's talking about predicting natural flow to members of the Surface Water Coalition. And when I look at paragraph 50, I see that it's talking about predicting storage allocations for

each member of the Coalition. Would you agree with that?

A. Yes.

Q. Great. So in Footnote 15, I see that there were a series of meetings held in the winter of '22-'23 with parties' technical consultants to discuss potential updates to the methodology order. And you are looking at trying to better predict Surface Water Coalition water supplies in April. That's what I take from that footnote; is that correct?

A. Yeah, that's accurate.

Q. Did you have any discussions with Water District 1 about how to improve the forecasting?

A. Not about how to improve the forecasting.

Q. How about to improve looking at storage water allocations?

A. We normally in the as-applied process, are talking to them about what they think the reservoirs are going to fill to what rights they are going to fill. And we don't ask them for an official opinion. But we do ask them for what they think is going to happen. And then we factor that into our storage allocations.

Q. Okay. In the as-applied?

A. In the as-applied, yes.

Q. Great. And then let's go back to Exhibit 928.

That was one that TJ was talking with you about. It was a technical working group document. And it was the last page in that exhibit, to make it easier to flip through.

A. So I'm at 928.

Q. The last page of 928; correct?

A. Okay. Page 22 for me.

Q. Correct, that's what I have.

A. Okay.

Q. "SWC Methodology Acres" is the title of the slide?

A. Yep.

Q. And at the bottom, Mr. Budge was asking you about these enlargement acres. And I believe I heard you say, you didn't know what enlargement acres were; is that correct?

A. Generally that's correct, yes.

Q. So do you know has the Department backed out any other enlargement acres, or are these the only ones that have been identified?

A. In terms of the methodology acres that we use, these are the only enlargement acres that I remember. There may be enlargement in the other one. I just listed these, because they were confusing to me about how we got to the 15,924.

Q. Okay. And that makes sense. So you don't

know then how many enlargement acres are within these other companies --

A. I do not.

Q. -- within in an irrigated area?

A. Sorry. I do not.

MR. BROMLEY: Okay. Thank you. I have no further questions.

THE HEARING OFFICER: Any further questions?

MS. McHUGH: Yes, Mr. Director, this is Candice. I just have a couple clarification questions.

THE HEARING OFFICER: Okay. Go ahead.

MS. McHUGH: And I had to switch to my headphones. So can everybody hear me okay?

THE HEARING OFFICER: You are audible.

MS. McHUGH: Okay. Great.

CROSS-EXAMINATION

QUESTIONS BY MS. McHUGH:

Q. Matt, my understanding from your testimony is that you've been involved with two different technical working groups, at least one relative to the Surface Water Coalition methodology orders, one in 2015, and one in 2022; is that correct?

A. Yes.

Q. Has there been any others relative to this Surface Water Coalition delivery call that you've been

involved in?

A. No other technical working groups that I can think of.

Q. Okay. And how are those technical working groups compiled, like who gets invited?

A. I don't remember on the 2015 technical working group. But for, we'll call it the 2022 technical working group, I asked the Director for guidance on who should be invited.

Q. And what were you instructed as far as who should be invited?

A. The response from the Director was to ask the parties who they wanted to attend.

Q. And by the "parties," do you mean the parties that had already been part of the Surface Water Coalition delivery call that dated back to 2008, 2009 time frame?

A. Yeah, I think so. The Surface Water Coalition, IGWA, and the Cities are who I talked to.

Q. Okay. And when does that invitation get sent out, and by what method?

A. My best estimate is in September, the Director at the status -- or at a status conference, said we were going to have a technical working group. So probably early September is when, or late August maybe, I emailed

the attorneys or the legal counsel for the different parties, and asked them who they wanted to attend the technical working group.

Q. Okay. And that was in 2022?

A. Yeah.

Q. Okay. And can you tell me what suggestions from the 2022 technical working group, did you recommend that be implemented in the Fifth Methodology Order, from non-Department employees? I should clarify.

A. I can't think of -- I don't think we used any or implemented any of the recommendations from the technical working group.

Q. And what -- any datasets or any kind of technical information, other than methods, did you recommend from the technical working group?

A. I didn't quite understand that question. Could you repeat it?

Q. I understood you to say that you didn't implement any suggestions as to like a method from the technical working group. And I was following up just to clarify. Did you use any improved data, or datasets, or, you know, that kind of information that was provided from the technical working group?

A. I don't think so.

Q. Okay. In the 2015 technical working group,

what suggestions from the 2015 technical working group, did you implement or recommend be used in the methodology?

A. I don't remember the recommendations from the different consultants at that point.

Q. Okay. But you think that you may have taken some from the outside consultants and incorporated into the methodology?

A. I don't know.

MS. McHUGH: I don't have any further questions.

THE HEARING OFFICER: Okay. Further questions from the ground water group? I don't see any hands raised.

So let's shift. And I think now the Surface Water Coalition, if you wish to question Mr. Anders, you may examine.

Mr. Thompson.

CROSS-EXAMINATION

QUESTIONS BY MR. THOMPSON:

Q. Good afternoon, Mr. Anders, Travis Thompson for A & B, et al. Just a couple questions.

(Exhibit 118 marked.)

Q. (BY MR. THOMPSON) So if you could turn to Exhibit 118. Would you please identify that for the

record?

A. Did you say 118?

Q. Correct.

A. I'm there.

Q. Do you recognize that document?

A. Yes.

Q. And were those comments submitted by consultants for the Surface Water Coalition?

A. Yes, they were.

Q. And did the Department consider those comments and others submitted by other consultants?

A. Yes, we did.

Q. I'm going to go back to a few questions on is it the irrigated land dataset that the Department created?

A. Yes.

Q. And you said they did one in 2011 and 2017?

A. Yes.

Q. And are those different staff that created those?

A. I think it was created by the same staff. But I'm not totally sure on that. They would have been IDWR staff.

Q. And that's a snapshot of a single year; is that correct?

A. Yeah. They are designed to just identify the irrigated, non-irrigated, and semi-irrigated for that year.

Q. And do staff ground proof those estimates with individual irrigators?

A. I don't know.

Q. How about individual canal companies or irrigation districts?

A. I also don't know.

Q. I think you testified earlier that you agreed that certain lands that show up irrigated one year, may not be irrigated the next; is that true?

A. That is true.

Q. And vice versa, non-irrigated lands may not be not irrigated one year, but irrigated the next?

A. Also true.

Q. You said those data land sets --

A. Irrigated lands dataset.

Q. Irrigated lands dataset. Sorry. Three categories, we've got an irrigated, non-irrigated, and semi-irrigated?

A. Correct.

Q. And do each of those categories have specific numbers of acres?

A. I don't understand the question.

Q. I think we talked about at least the example for Twin Falls Canal Company, the 2017 dataset had a number of like 179,000. Do you know if that was the irrigated lands dataset for that year?

A. Each -- we can calculate the acres for each one of those categories. The 179 was what was left, the number of acres, irrigated acres left in the shapefile from Twin Falls Canal Company after we removed the non-irrigated using the irrigated lands dataset.

Q. So it would include semi-irrigated?

A. Yes, that would include semi-irrigated.

MR. THOMPSON: That's all the questions I have. Thank you.

THE WITNESS: Thank you.

MR. FLETCHER: No questions.

THE HEARING OFFICER: All right. Let's circle back again.

Mr. Wood, do you have any questions?

MR. WOOD: Just a couple.

REDIRECT EXAMINATION

QUESTIONS BY MR. WOOD:

Q. Hi, Matt. Do you recall testifying earlier about using Twin Falls Canal Company's irrigated acres dataset?

A. I do.

Q. And do you recall attorneys for the ground water users suggesting that the Department should use Twin Falls Canal Company's irrigation acre dataset rather than the decreed acres?

A. I didn't understand the question there.

Q. Do you recall a suggestion that the Department should use Twin Falls Canal Company's irrigated acres, rather than their decreed acres?

A. I think what they were recommending was we use the irrigated acres after we removed the non-irrigated with the irrigated lands dataset.

Q. That's a better way to put it. In your opinion, what would it take from a staffing perspective to implement the dataset as suggested by the ground water users?

A. Those irrigated lands datasets take about one year of staff time to make, to review and to do the edits. So we would have to dedicate quite -- I mean, if we wanted to do it in the current irrigation season, we would have a lot of staff time trying to get it done in time to be used with the methodology. If we did a year like the previous year, we would still have to exert a lot of effort to get it created.

Q. So are staffing issues one of the reasons that the dataset wasn't used?

A. Yeah. It's one of the reasons we don't have, say, a 2022 dataset, or a 2021. A new one every year, yes.

Q. Switching gears a little bit. Do you recall testifying about Twin Falls Canal Company's regression equation?

A. I do.

Q. And based on the R-2, do you think the regression equation still accurately predicts the natural flow for the Twin Falls Canal Company?

A. We think it accurately is still predicting the natural flow for Twin Falls Canal Company. But we're concerned about the downward trend in the R-squared value, indicating that it may be degrading. That the regression may be degrading. But we still have confidence in it at this point. We want to see it in a couple more years and see what happens.

MR. WOOD: Thank you. No further questions.

THE HEARING OFFICER: Further questions from the ground water group?

Mr. Budge.

RECROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Just a couple questions, Matt. I'll take them in reverse order.

First, regarding the regression equation for Twin Falls Canal Company, you were asked whether the current regression formula still accurately predicts the forecast supply? Do you recall that question?

A. I do.

Q. Accuracy is a matter of degree; right?

A. Okay.

Q. So you would agree that the prediction is becoming less accurate over time?

A. I think that's what the R-squared is telling us, that statistic, yes.

Q. So your testimony is, in your opinion, it's not become so inaccurate, that you can't use it at all?

A. Not yet.

Q. Okay. But that time could come?

A. It might come. It might -- we have seen them stabilize. It might stabilize where it is. It might go up a little bit. We don't really know.

Q. Okay. Next, just about the staffing required to create an irrigated lands dataset. When you answered that it takes a lot of work. You are talking about creating a new irrigated lands dataset?

A. Yes, I think they often start with the previous one. But to create a new one, it is a lot of staff time to update the lines, and to do all the

analysis. We are experimenting with ways to automate that. We don't have it to the point where we think we have the accuracy that we want to yet. If we could get to an automated method, we might be able to get one for every year. We don't know yet, but we are experimenting with it.

Q. Okay. And once the 2017 dataset was created, it certainly could have been implemented in the methodology in, say, 2018?

A. Well, I don't know when that dataset was finished. For example, they're working on 2021 right now. So it would have been at some point after. And if it takes a year, it probably would have been a couple of years after when it became available. I'm just estimating. I don't know when exactly they started on that one. But there is a lag there by at least a year and maybe more.

Q. I understand. Are you familiar with the near real-time metric dataset?

A. I am.

Q. And that dataset also, if I understood Ms. Sukow, also can tend to delineate irrigated versus non-irrigated acres?

A. Yeah, it's showing ET, or actual ET on the ground. So, yeah, it can indicate whether something is

irrigated or not.

Q. And that dataset I believe is available annually?

A. The metric dataset or the near real-time metric?

Q. Let's start with the near real-time metric.

A. Right now we're in testing mode with the near real-time metric to see if we can do it on schedule. But we need further methodology. So that one, I don't know if we have 2022. But up to that point, we were getting it like July 5th, August, September, so we had that one real-time, yes.

For metric, I don't know if they've done all the years for metric, because they make that decision after the season is over and based on the cloud cover. Clouds are difficult for, to get a good metric dataset if you've got a lot of clouds. So I don't know what years they have done.

They don't always -- for example, we did real-time metric, but they didn't do metric for all those years that we did near real-time.

Q. So it sounds like there are tools available or under development that are going to enable more frequent evaluation of irrigated acres using metric or the data lands, the irrigated lands dataset?

A. I think there is things, yeah, developing.
Q. And in terms of the staffing, it wouldn't be hard to plug a different acreage figure into the methodology order, that could be done, you know, with a push of the button. The staffing you are talking about is creating a new dataset, or an updated dataset?
A. You are correct.
Q. So the Department could today rerun the methodology with the figures from the 2017 irrigated lands dataset, and that would not take a lot of time?
A. No, you are correct, that would be easy.
Q. And they could do the same with the most recent metric or near real-time metric data?
A. Once we have the number, it's easy to plug into the calculator.
MR. BUDGE: Okay. That's all I've got. Thanks, Matt.
THE WITNESS: Thank you.
THE HEARING OFFICER: Further questions from the ground water group?
And one more chance for questions from the Surface Water Coalition. Any further questions?
Apparently not. Okay. We are finished with Matt Anders.
(Witness dismissed.)

THE HEARING OFFICER: It is 4:30. I don't see Jay Barlogi in the gallery. So I'm assuming that Jay is next; is that correct?

MR. THOMPSON: Yes, Director. I've been in communication with him and have him online if that's an option. I guess depending on what the parties want to do?

THE HEARING OFFICER: What's the preference of the parties?

Mr. Bromley?

MR. BROMLEY: Well, I was going to take the primary lead of questioning of Mr. Barlogi. I do have some physical exhibits. And he's not here to look at those.

THE HEARING OFFICER: Are we expecting Mr. Barlogi in person tomorrow?

MR. THOMPSON: Yes.

MR. FLETCHER: He will be here in the morning.

THE HEARING OFFICER: Well, I think we're on schedule, and maybe just a little ahead looking at the list of witnesses, so perhaps --

MR. ANDERSON: Just as a --

THE HEARING OFFICER: Mr. Anderson?

MR. ANDERSON: Just as a way to save time, I have a matter that I could take up just quickly

regarding the order that you made this morning. It's a little off-the-cuff, but just a couple minutes. If it's okay?

THE HEARING OFFICER: Okay. That would be fine. But as Mr. Anderson is coming forward, it appears to me that we're at a logical breaking point. And maybe we ought to adjourn following Mr. Anderson's presentation.

MR. THOMPSON: Could we move to admit Exhibit 118?

THE HEARING OFFICER: Pardon me?

MR. THOMPSON: Could we move to admit Exhibit 118?

MR. FLETCHER: That was the Surface Water Coalition comments on the recommendations to the technical working group.

THE HEARING OFFICER: Prepared by Dave Colvin and Dave Shaw, I think so.

MR. FLETCHER: I think, yeah.

THE HEARING OFFICER: Yes. Any objection to admitting the document marked as Exhibit 118?

Seeing no objection, the document marked as Exhibit 118 is received into evidence.

(Exhibit 118 received into evidence.)

MR. ANDERSON: Thank you, Director. Just as a

way of utilizing our time wisely, and this is a little off-the-cuff given the order that was this morning. I am just doing a brief, ask the Director to reconsider the order regarding economic benefit, just some really small discussion regarding that. And then in the alternative, just offer an informal offer of proof here, if that's okay?

THE HEARING OFFICER: Go ahead.

MR. ANDERSON: In the Fifth Methodology Order, Exhibit 300, I believe, which we've been talking about. There are conclusions, specifically conclusions No. 6. And it talks about the public interest, full economic benefit and optimum development of water resources for the public interest. It talks about full economic development in the result of the optimum development of water resources. The policy of securing the maximum use and benefit and least wasteful use of the state water resources applies to both the surface water and ground water. And I'm kind of paraphrasing a little bit. But these are all quotes from cases in the sixth finding in the methodology order.

The issue I think is the lack of facts cited to support that finding. I think the lack of facts is what the Department relied on earlier in making an order that the methodology didn't address economic issues.

And so it was beyond the scope to address those at this hearing.

I think the lack of facts cited in making this finding of No. 6 is a reason why economic issues should be permitted into this hearing, to bolster the facts, and bolster the evidence in making that finding. Whether or not the Department gives them whatever weight the Department wants, I certainly think it's within the public interest to do so. I would argue that perhaps the decision of the Department to go with steady state in the first place rather than change of methodology order to be con-transient in itself has some inherent economic aspects. So I would just ask the court to reconsider.

In the alternative, rather than do a formal offer of proof, I think that in this case an informal offer of proof would be streamlined and everyone would appreciate it, just given the fact that we have an expert that would be traveling from out of town to do that formal offer of proof. And I think it was Judge Stegner, when he was a judge said that an informal offer of proof is appropriate when the attorney presenting it is not simply conclusory stating the summary of facts that will be presented, and is not hypothetically stating facts that may be presented.

Here we have a simple expert report. And so I would just like to informally submit that as an offer of proof in the alternative that the Department wouldn't reconsider its decision on excluding economic testimony.

THE HEARING OFFICER: Okay. Thank you, Mr. Anderson.

I'm certain the Surface Water Coalition wants to respond. Mr. Thompson, Mr. Fletcher.

MR. FLETCHER: Director, we agree with the Director's ruling on this issue. We were surprised by the issues people wanted to raise in this methodology. A lot of these issues were raised in the earlier methodology. There is multiple cases dealing with this issue. And it's not a matter of wanting economic harm to the various parties in order to determine who should receive the water under the priority doctrine. And so we agree with how the Director ruled on this issue this morning.

MR. ANDERSON: A 30 second rebuttal.

THE HEARING OFFICER: Sure, Mr. Anderson.

MR. ANDERSON: And I agree, it's not necessarily about weighing the harm between the parties. But when you have such an exorbitant curtailment at stake, it's certainly relevant for the Department to take that into consideration in the public interest and

use of the resource. It has nothing to do with the economic benefit or realization of the two parties and comparing them. It's just something that the Department is within its discretion as the courts' have said to consider.

THE HEARING OFFICER: All right. Well, thanks, Mr. Anderson. I'll at least take the motion, and I'll characterize it as a motion, under advisement. And rule on it tomorrow morning when we start.

I will tell you, though, that I have read the motion in limine, or the motion to limit, and have at least reviewed the citations and the quotes. And have some memory of those decisions that were issued by the court related to whether the Department could consider the economic benefits as part of determining whether a junior, or the holders of junior-priority water rights should be curtailed.

And I thought at least one of those quotes was telling, because the court essentially said that the Department should not be reviewing. And the Director should not be reviewing the respective economic benefits of water use. And delving into the actual financial standing and books of the various parties. And the warning I think from the courts was that it would compromise the prior appropriation doctrine. And the

expected administration of water rights under the prior appropriation doctrine.

So I'll take it under advisement with I guess some reluctance. But I'll look at it, and rule on it in the morning.

Okay. Anything else we need to talk about?

MS. McHUGH: Mr. Director, this is Candice. This doesn't have to be on the record. It is just a housekeeping piece.

THE HEARING OFFICER: Well, go ahead. We're on the record.

MS. McHUGH: Okay. Fair enough. I'm traveling by air tomorrow for the most part, and so just as a courtesy to the Director and the parties, I won't be participating the full day remotely. But just kind of wanted you to know that I'm not missing in action. If all of the sudden I'm off, it is because I'm actually traveling tomorrow.

THE HEARING OFFICER: All right. Thanks for the heads up, Candice.

So what time should we start in the morning? Do you want to start at 9:00? Do you want to start at 8:30? What's the preference? Do you want to start at 7:30?

MS. KLAHN: How about 9:00?

THE HEARING OFFICER: 9:00.

MR. FLETCHER: 9:00 is fine.

THE HEARING OFFICER: All right. Let's start at 9:00 a.m. tomorrow morning. Thanks for the help from everyone here. And we'll adjourn for the night. So let's go off the record and then review the exhibits.

(Hearing adjourned at 4:46 p.m.)

REPORTER'S CERTIFICATE

I, COLLEEN P. DOHERTY, CSR No. 345, Certified Shorthand Reporter, certify:

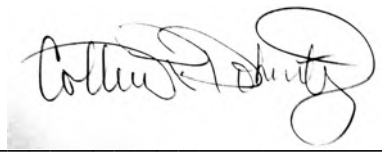
That the foregoing proceedings were taken before me at the time and place therein set forth, at which time the witness was put under oath by me;

That the testimony and all objections made were recorded stenographically by me and transcribed by me or under my direction;

That the foregoing is a true and correct record of all testimony given, to the best of my ability;

I further certify that I am not a relative or employee of any attorney or party, nor am I financially interested in the action.

IN WITNESS WHEREOF, I set my hand and seal this 16th day of June, 2023.



COLLEEN P. DOHERTY, CSR 345
Notary Public
P.O. Box 2636
Boise, Idaho 83701-2636

My commission expires September 7, 2023.

P R O C E E D I N G S

HEARING OFFICER: So we're recording. We have a new court reporter this morning.

Will you introduce yourself, please.

COURT REPORTER: My name is Andrea Check. Good morning.

HEARING OFFICER: I'm sorry, Andrea. I cut you off. Go ahead.

COURT REPORTER: I'm Andrea Check. Good morning.

HEARING OFFICER: All right. Thanks everybody. Let's see. We need to turn microphones on, and maybe I'll turn this one on. I think we just leave these on so that we don't have to worry.

And we have a number of participants who are listening in remotely. I -- because -- well, it shows Candice McHugh is on, at least for a time.

MS. McHUGH: Yes. I'll be here this morning.

HEARING OFFICER: Okay. Thank you, Candice.

All right. And as I scan the room, it looks like everyone else is here. We have at least one preliminary matter to address this morning, and that's an informal offer of proof that was presented or offered late yesterday.

And the offer of proof, Mr. Anderson, I understand, is that you want to have at least what's been marked as Exhibit 400 lodged in the record as an offer.

And this, at least, purports to be a report by Darryll Olsen regarding economic impacts surrounding water right, water supply restrictions.

And so I guess before I rule on this offer of proof, Surface Water Coalition, do you have any objection to this document being lodged but not being part of the record?

MR. FLETCHER: Well, it's my understanding it's being lodged for the purposes of the -- I think the term you used was "informal offer of proof"?

HEARING OFFICER: Yeah.

MR. FLETCHER: And for that purpose, I don't think we really have grounds for objection, but we would object to it being introduced as an exhibit.

HEARING OFFICER: So based on my review and the request for this document to be lodged as an offer of proof, I'll allow it to come in, not as an exhibit, but just as an offer of proof so that at least the document is there. And if there's -- the reviewing courts determine in some subsequent appeal that it should have been considered, then it won't have to come

back.

(Exhibit 400 received for offer of proof purposes only.)

HEARING OFFICER: Now, as part of this ruling, I guess, I think it's important to go back and just excerpt some of the prior decisions by the --

COURT REPORTER: Can you hang on for one second?

HEARING OFFICER: Sure.

COURT REPORTER: My machine just stopped.

HEARING OFFICER: I thought you were struggling with my inarticulate delivery.

COURT REPORTER: No. But I might need -- can we go off the record for one minute?

HEARING OFFICER: Sure. That would be fine.

(Break taken.)

HEARING OFFICER: Back on the record.

Thank you, Andrea.

Okay. Well, the court reporter has said that at least some of what was said she didn't capture, so let me see if I can rehabilitate.

So it's my understanding that there were actually two matters in front of me: One was a motion to reconsider my ruling that I would not accept evidence regarding the economic impacts of possible curtailment

resulting from the -- a delivery call and associated methodology order amendment and also an informal offer of proof.

And probably in the proper order of discussing in this matter, I ought to at least address the motion for reconsideration. And I'd just excerpted a couple of passages from the Clear Springs decision, Clear Springs Foods versus Spackman, issued in 2011 by the Idaho Supreme Court where the Court said that: "A delivery call cannot be denied on the grounds that curtailment of junior appropriators would result in substantial economic harm."

And then, further: "'Full economic development'" -- which was argued yesterday and referenced in the constitutional provisions -- "'Full economic development of underground water resources' does not mean that the groundwater appropriator who is producing the greater economic benefit or would suffer the greater economic loss is entitled to use of the groundwater when there is insufficient water for both the senior and junior appropriators. If that were the basis for allocating water in times of shortage, then water would be allocated among farmers based upon market prices and their respective crops and their expected yields."

And so from my perspective, this particular issue has been addressed by the courts previously. And, furthermore, it's not an issue that is part of the Methodology Order and the underlying facts that were considered in amending the Methodology Order.

So as a result, I'll again verbally deny the motion to reconsider, but I will allow the document to be -- the document marked as Exhibit 400 to be lodged in the -- or at least be lodged with the record but not part of the record if some reviewing tribunal wants to take this up and reverses my ruling on the presentation of evidence regarding economic harm and respective economic comparisons.

Okay.

MR. BAXTER: Director?

HEARING OFFICER: Yes?

MR. BAXTER: Could you turn your microphone on, please.

HEARING OFFICER: Oh, I'm sorry. Thank you. We've been on and off and on and off. Thank you.

Okay. Are there other matters we need to talk about this morning?

All right. We have a witness slated to be called. I think the next witness is Jay Barlogi.

Mr. Barlogi --

Is that correct, Mr. Thompson?

MR. THOMPSON: Yes.

HEARING OFFICER: Mr. Barlogi, if you'll come forward, please. If you'll raise your right hand.

JAY BARLOGI,

called as a witness by the Surface Water Coalition, having been first duly sworn to tell the truth relating to said cause, testified as follows:

HEARING OFFICER: Thank you. You may assume the seat of discomfort.

Mr. Thompson?

MR. THOMPSON: Thank you. Travis Thompson for A&B Irrigation District, et al.

DIRECT EXAMINATION

QUESTIONS BY MR. THOMPSON:

Q. Mr. Barlogi, can you please state and spell your name for the record.

A. Yeah, my name is Jay Barlogi. It's J-a-y, and the last name is B-a-r-l-o-g-i.

Q. And when did you start working for the Twin Falls Canal Company?

A. I started working in 1993.

Q. And what positions have you held since that time?

A. I started out as a ditch rider. I moved up to the East End watermaster, moved from there into the field supervisor position, and then moved from there into the general manager position.

Q. And if you could look behind you, I think there should be a binder of Surface Water Coalition exhibits.

A. Thank you.

Q. If I could have you look at Exhibit 1, please.

Can you generally describe that document for the record?

A. Yes. This is a document that I put together that is titled, "Direct Testimony of Jay Barlogi." It just kind of explains, more or less, how we operate at the Twin Falls Canal Company.

Q. And that's based upon your personal experience and work history with the company; is that correct?

A. Yes, sir.

Q. If you could turn to page 27 on that exhibit, please.

A. Okay. I'm there.

Q. And is there a graph that depicts Twin Falls Canal Company diversions 1988 through 2002?

A. Yes, sir.
Q. 2022. I'm sorry.
A. Yes, sir.
Q. And did you prepare that graph?
A. Yes, sir.
Q. What was the source of the data for that graph?
A. That source was Water District 1 accounting data.
Q. Director, if I might approach. I've got --
HEARING OFFICER: Yes.
MR. THOMPSON: -- a better copy marked as Exhibit 1A.
(Exhibit 1A marked.)
Q. (BY MR. THOMPSON) Jay, can you describe what's been marked as Exhibit 1A for the record, please.
A. Yes. This is a bar graph that I put together. This -- each bar represents an individual year from 1998 -- or from 1988, rather, through 2022. And these are our annual diversions from April 1st through October 31st of each of those years since 1988.
Q. And is that just a larger version of that graph contained in your pretrial testimony at page 27?
A. Yes, sir.
Q. Jay, since 2010, can you just generally

describe how the company delivers water to its shareholders?

A. Certainly. We do it pretty much the same way we always have. We divert water out of Milner Dam. We divert it through our Shoestring Canal down to Murtaugh Lake, which is a recharge -- or not a recharge, but a re-regulating reservoir within the system. It flows out of there into our Main Line Canal around the Hansen Butte, where it hits forks where it bifurcates into the High Line and the Low Line Canal that run all the way to the west end of our system and both expire at Deep Creek.

Off of all of those canals, the Shoestring, the Main Line, the High Line, and the Low Line, there are over 1,000 miles of smaller canals that come off of those larger waterways where we divert water to our shareholders out of over 4,000 different headgates that we measure. As those individuals call in-season and ask for their water to be turned on, our ditch riders take those calls every morning between 7:00 and 7:30, and then they go out and start delivering that water. They go to one meter at a time, measure the appropriate amount out of the gate, lock it up, and go on to the next gate.

Q. And how about your maintenance activities, can

you just generally describe what the company does to maintain its system?

A. Sure. Maintenance activities have really kind of got, I guess, two seasons. Certainly during the irrigation season our maintenance activities are different than they are during the nonirrigation season.

During the irrigation season we have crews out right now with several different mowing tractors mowing weeds along the edges of the canals. As you can imagine, this time of year the weeds are beginning to grow, the grass is beginning to grow. It's important that we maintain that weed and grass growth, as it occludes the channels, forces us to push harder to get the water through to the end.

We also have multiple excavators that spend much of their time this time of year cleaning canals and cleaning sediment out of the bottoms of canals. As we start irrigating -- preirrigating bean ground this time of year, the sediment ponds at the ends of the fields and many of our water quality projects are beginning to fill up or starting to fill up. So those excavators are out right now cleaning canals, making sure the water flows freely through those canals.

As you can imagine, this time of year, it's early in the season, as we bring the water level in the

canals up, there's a leak that shows up here and there, and the excavators are out making those repairs.

Moss growth is beginning to accumulate in the waterways now. Generally, in the middle of June we have to treat the main canals. But certainly throughout the month of June we're putting chemicals in, and we're eradicating moss out of the system before the moss chokes the system up to the point that we cannot shove the water through to those water users at the end.

That's pretty much the extent of the -- well, that's a lot of what we do, anyway, this time of year.

During the nonirrigation season -- we typically have at least a large project or two during the nonirrigation season that can be -- that could be new lining projects, it could be new water quality projects.

And then we also do a lot of work on the bottoms of the canals throughout the year. As you go through the course of the season, as you can imagine, the channel ends up with silt berms here and there that need to get cleaned out, and we need to make sure that the water flows really well through those main canal systems.

We also have an extensive concrete program. We have over 10,000 concrete structures on our system,

so it's really, really important that we replace those on a regular basis. We always say if we replace 100 of those a year, I could overturn our inventory of concrete structures once every 100 years. So we do in excess of 100 concrete structures a year and those concrete structures are --

COURT REPORTER: Mr. Barlogi, can you slow down just a little bit for me, please.

THE WITNESS: Sure.

Those concrete structures are typically measuring devices that we rehab or replace.

Several new ones come in every now and again as water deliveries have changed as the transition from gravity to sprinkler irrigation continues to be ongoing on the project.

Maintenance crews are also -- maintenance -- the maintenance foreman and the field supervisor are also spending a lot of time during the offseason out working with water users. As they put sprinkler systems in, we make sure that the way those sprinkler systems are installed works well with our system and doesn't create adverse impacts.

Q. (BY MR. THOMPSON) So do you have dedicated staff for both maintenance and then water delivery operations?

A. Yes, sir.
Q. And it's fair to say that there really is no offseason for what you do in the canal?
A. No. No, there's not. No.
Q. And can you generally describe any larger projects since 2010 that have been implemented to help canal operations?
A. Certainly. We have -- we have -- since 2010 and prior, we have an ongoing list of projects that we continue to try to identify and implement.
We've put in several different lining projects. We've done lining projects on the Low Line Canal, on the High Line Canal, on the Shoestring Canal.
We've done canal work in the bottom of the Main Line Canal. We've put in multiple different water quality facilities. We've put in several different new automated structures at the heads of some of these waterways, and a few of these have specific diversions within the canal system.
Somewhere around 2010, 2011, we built the Kinyon Pond on the far west end of the system. That's somewhat of a re-regulating reservoir down on the far end of the High Line Canal.
Q. And those projects, would you characterize as

just helping you provide a level of service and delivery to your shareholders as you always have?

A. Absolutely. Yeah. It's all in the interest of providing a high level of service to our water users while operating the system prudently.

Bear in mind, most of these activities are all centered around the total capacity of the canal system. And if the capacity gets compromised, then we're operating with more risk than we need to be operating with.

So we manage the weeds, we manage the moss, we manage the flow in these waterways so as not to put any additional pressure on the banks and cause possible seeps or possible canal breaks throughout the season.

So we do everything we can to provide a high level of service to our water users while operating the system prudently.

MR. THOMPSON: That's all the questions I have, Director. I'll turn Mr. Barlogi over for cross-examination.

Oh, yeah, those two exhibits I would offer, Exhibits 1 and 1A, into the record.

HEARING OFFICER: Any objection to the documents marked as Exhibits 1 and 1A?

The attorneys for the groundwater users have

had a chance to, apparently, review this written testimony of Jay Barlogi and are comfortable with the admission of this document?

MR. BROMLEY: Yes.

HEARING OFFICER: Mr. Budge?

MR. BUDGE: I'm comfortable with it generally, but there's one item of hearsay that I would like to have stricken from it. It's on page 22. And it's lines 17 through 20. And it says, "Somewhere in the archives of historical information about the Twin Falls Canal Company a state engineer was quoted as saying," and then there's a quote. So that component of the prefiled testimony I would move to be stricken; the rest of it I'm okay.

HEARING OFFICER: Mr. Thompson?

MR. THOMPSON: That's fine. I can ask Mr. Barlogi on redirect about that statement.

HEARING OFFICER: Okay. Well, normally, I'm reluctant to accept written testimony because I like to hear the testimony of the witness, but in the interest of time and recognizing that this hearing has been expedited and we're trying to finish as soon as possible, I'll allow testimony into the record with the qualification that the quoted material and the written testimony is excerpted or deleted out of the testimony.

And so with that qualification, I'll accept Exhibit 1 and Exhibit 1A into evidence.

(Exhibits 1 and 1A received.)

HEARING OFFICER: Mr. Budge.

MR. BUDGE: Just logistically, does that mean the Department will take the action of redacting that portion of the exhibit?

HEARING OFFICER: Well, at least right now, I'm anticipating that there might be further questions related to that language. So at least right now, I'll leave it there, and let's see where it goes, Mr. Budge. But please remind me as we go through their testimony, though. Thank you.

Okay. Mr. Bromley.

MR. BROMLEY: Thank you, Director. Chris Bromley on behalf of the Coalition of Cites.

Mr. Barlogi, I took your deposition in Twin Falls. And thank you for being here.

And I do want to say I appreciate both what the attorneys from Surface Water Coalition and Mr. Barlogi, Director, that they prepared the prefiled testimony. It's helped us speed this process up. I know, ordinarily, it's not something we would do, but in the interest of time, it is helpful. And Mr. Barlogi and I discussed all of these topics, really, at his

deposition. So when I read the prefiled testimony, it meshed with, you know, what we discussed at the deposition. So I appreciate that we were able to truncate that, so thank you.

HEARING OFFICER: Good. Thank you.

CROSS-EXAMINATION

QUESTIONS BY MR. BROMLEY:

Q. Okay. Mr. Barlogi, I'd like to talk first about Twin Falls Canal Company's shares. So according to your direct testimony, there are 202,690.93 outstanding shares; is that correct?

A. Yes, sir.

Q. Okay. But Twin Falls Canal Company delivers to fewer than 200,000 acres; isn't that correct?

A. Yes, sir.

Q. Okay. What's the current assessment for the company?

A. Current maintenance fees per share?

Q. Yes, sir.

A. It's $27.

Q. And how often does the company increase its assessments?

A. I would say as needed. I think this last assessment increase was last year. I think -- I don't

know. I would tell you as needed. I don't think we'd had an increase prior to that for four or five years.

Q. What was the prior assessment fee? Do you recall?

A. 26.

Q. Okay. Is that generally what it goes up by, a dollar or so?

A. Yes.

Q. Thank you.

You stated in your deposition that the company operates on a continuous flow; is that correct?

A. Yes.

Q. And you'd agree, however, that every acre within the project isn't irrigated every day; correct?

A. Yes.

Q. You also stated in your deposition that the company doesn't require its farmers to rotate water with one another; is that correct?

A. Yes.

Q. But if Twin Falls rotated, wouldn't you agree that the supply would be extended?

A. No.

Q. Why is that?

A. Well, you suggested that they should be rotating water between farmers.

Q. That's correct. And if I didn't ask that well in the question, that is the question, that having farmers rotate water with one another. So, you know, Farmer A is on a Monday; Farmer B is on a Tuesday. They rotate with one another. So water is moving from field to field.

Do you follow that?

A. I do. And I think you need to understand our project a little bit. One farmer has likely got a field of hay and a field of grain and a field of corn and a field of potatoes and sugar beets, and he rotates within his farm. And that farmer is generally using his water every day throughout the irrigation season. And he's rotating within his own farm. The next farmer has a very similar situation throughout the project.

So, no, they don't rotate between farm -- between farmers. They rotate within their farm.

Q. Correct. And you had said that farmers are not rotating with one another; so, you know, one farm is on, the next farm is off.

I'm asking you, wouldn't it extend the supply of water if Twin Falls Canal Company farmers were to rotate water with one another?

A. No.

Q. And why is that?

A. Well, I would say that on any given day, the diversion is meeting the needs of the farmers every day. So I don't know where there would be a place to rotate that water to.

Q. But not every acre is irrigated every day; correct?

A. Correct.

Q. So if demand is off on one field and demand is on on another field and farmers are rotating with one another, as we see in other parts of the state, it ought to reduce demand; correct?

A. Yeah. I suppose if there was a need to do that, but there is not a need to do that. Again, they rotate within their own farm to do that.

Q. Okay. How does the company track share ownership?

A. Well, it's tracked through the certificates. We have a program in the office, they call it "Magic," who attracts -- who owns all of the shares within the project. As land sells, folks come in, we change the names on the certificates and transfer those shares to the new owners. Water moves from one farm to another. The certificate is changed to reflect the new point of diversion, the new place of use.

Q. Is that important for the ditch riders to

know?

A. Absolutely. Of course.

Q. How does the company track changes in place of use for shares?

A. Well, if the place of use changes, we call that a transfer. There is a transfer policy, and those folks will come in, and they will apply for the transfer. That paperwork then goes to the watermasters first who can look through the paperwork and identify if that transfer and physically moving that water from one place to another is feasible, or does it present a capacity issue? Does it present a flooding issue? Does it present a measurement issue at the headgate?

And if it does, of course, he will put his suggestions in there that this is not a very good transfer; and if it doesn't, then he will sign off on it. And then it goes to the board of directors, who reviews the application, compares it to the transfer policy, and if it complies with all of the parameters of the transfer policy, then they will approve it. If it doesn't, then they do not approve it.

Q. Thank you.

At your deposition, we discussed the percentage increase in sprinklers from 2008 to present.

Do you recall that discussion?

A. I do.
Q. I'll try and do a better job of finishing my question, and look at you.
A. I'll do better as well.
Q. Thank you, Mr. Barlogi.
Okay. So when we were discussing on that point, do you still agree that, in 2008, the percentage of fields that were irrigated by sprinkler was about 25 percent?
A. Yeah. Yes, I do.
Q. Okay. And then in your deposition, we also talked, and I see it as well in your direct testimony, that you state the Twin Falls Canal Company is approximately 50 to 60 percent sprinkler irrigated now?
A. Yes.
Q. So if -- the company's approximately doubled the number of sprinklers on the project in the last 15 years; is that correct?
A. Certainly doubled the percentage, yes.
Q. Okay. And as for conversion to drip irrigation, which we talked about in your deposition, we were discussing a 400-acre field that's now lettuce; is that correct?
A. Well, I think it's multiple different fields, but I think there is about 400 acres of lettuce on the

project this year.

Q. Okay. So Mr. Barlogi, let's look at Exhibit 332.

All right. Are you there, Mr. Barlogi?

A. Yes, sir.

Q. Do you recognize this exhibit?

A. I do.

Q. Okay. This was an exhibit we talked about at your deposition. And my understanding of this exhibit is that it explains what the deliveries are year by year, month by month, and day by day; is that correct?

A. What the rate of deliveries are, yes.

Q. Thank you.

And I notice the way that this exhibit has now been put together, it's kind of out of order in the years, but we've got years from -- oh, let's see -- 1990 to, I think, about the present.

Is that what you see?

A. Yes.

Q. And so we can look at this -- and just to make it easy, we'll be on the first page. In the 1990 -- and I see -- and this was produced -- is yours produced in color?

A. Yes.

Q. Okay. Great.

So the blue represents three-quarters of a miner's inch -- is that correct? -- in 1990?

A. Yes, the .75 blue.

Q. Yes, sir.

And so in 1990, it was a delivery of .75, or three-quarters of a miner's inch, from the beginning to the end of the irrigation season; is that what that shows?

A. Yes.

Q. Thank you.

And so then in a year like 1992, just to keep it simple and we're on the same first page, the company started with a delivery of three-quarters of a miner's inch from April until May 3rd; correct?

A. Yes.

Q. And then shifted on May 4th to 0.625, which is the equivalent of five-eighths of a miner's inch; correct?

A. Yes.

Q. And then on May 18th through the rest of the season, the company then reduced to .5, which is half a miner's inch; correct?

A. Yes.

Q. Okay. And so we could go through that exhibit and look at all of these different years, but I don't

see a reason to do that.

The benefit of the exhibit, as I understood it, Mr. Barlogi, from the deposition, was this helps explain what the company was delivering to its farmers; true?

A. Yes.

Q. Thank you.

Okay. How much is the company delivering this season, today?

A. Currently, we are currently delivering three-quarters of an inch per share.

Q. Let's talk about cropping patterns.

Okay. What have you noticed, Mr. Barlogi, with cropping patterns over the last 15 years?

A. I think the main thing that we've noticed over the last 15 years has been related to the dairy industry. The dairy industry has moved into our area in a very big way, and so high-water-consumptive crops have moved in as the dairies are looking, constantly, for alfalfa and corn to feed the cows. So alfalfa and corn acres have increased significantly.

I would also add that with the sprinklers and the sprinkler ground continuing to convert from gravity to sprinkler has brought the potato market, I think, further into the project, historically.

I think currently there are significantly more potatoes grown on the project than there were historically.

Q. How many acres do you think are planted in alfalfa this year?

A. I wouldn't have any idea.

Q. How about corn?

A. No idea.

Q. How about potatoes?

A. No idea.

Q. But they've gone up, in your estimation?

A. Certainly.

Q. Okay. We talked in your deposition -- you were saying that there are farmers within Twin Falls Canal Company who are now getting five cuttings of hay; is that correct?

A. I think, again, they're trying to meet the demands of the dairy industry. So if they can get it, they will.

Q. And could you explain how that's possible?

A. Yeah, I can, to some extent. I'm not a farmer. I know that very often times as we get into the spring, the dairies have exhausted their supply of feed. So quite often you'll see a hay crop go off when it's not near as high as it used to be, but they'll move in

there with the green choppers, and they'll take off the crop really quick and get it to the dairy industry.

And you'll see the same kind of thing with that last cutting. So often the first and last cutting of those five cuttings aren't real big cuttings.

But, absolutely, the needs of the dairy industry drive the market.

Q. And what we talked about at your deposition was something I believe you were calling a "green chop."

So the hay, it's being cut, and it's being taken off the field almost immediately; is that correct?

A. Yes, sir.

Q. How long has that practice been going on?

A. Well, I would say that -- gosh, I don't know how long. It came in kind of with the dairies.

Q. And the former practice was to cut hay, you'd let it dry, you wouldn't irrigate the field. Eventually, it would get baled, picked up in some way, and then water would be put back on 7 to 10 to 14 days later; is that right?

A. Yes.

Q. And that's changed now with the dairy industry?

A. Yes.

Q. Okay. Do you know how many acres are getting

five cuttings of hay?

A. I do not.

Q. And I believe you understand that the Director is now using the ESP model and what's referred to as "transient" as opposed to "steady state"?

A. Yes.

Q. And that's changed the curtailment date. And currently we have a 1953 curtailment date to produce 75,200 acre-feet to Twin Falls.

Do you understand that?

A. Yes.

Q. Do you think it's reasonable to curtail groundwater rights junior to 1953 so some Twin Falls Canal Company farmers can get five cuttings of hay?

A. I guess I wouldn't prospect to what is reasonable.

Q. Do you think it's fair?

A. I guess I wouldn't argue fairness either.

Q. Let's talk about subdivisions, Mr. Barlogi.

And if you could turn to Exhibit 334.

All right. Do you recall this exhibit?

A. Yes, I do.

Q. We talked about it at your deposition, and you agreed with me that, based on what's shown in the graph, that Twin Falls County has grown by 19 percent since

2010. Correct?

A. Yes.

Q. Okay. And you also stated during your deposition, Mr. Barlogi, that, in your opinion, most of the growth has been in the cities; is that correct?

A. Yes.

Q. So as to subdivisions, wouldn't you agree that rooftops, sidewalks, driveways, patios, and roads can't be irrigated?

A. Yes.

Q. Let's look at Exhibit 171. So you'll need another binder.

A. I'm sorry. Did you say 171?

Q. I did, yes.

Are you on Exhibit 171?

A. I am.

Q. And what's the title of that exhibit?

A. "Estimate of Non-Irrigated Acres Within Twin Falls Canal Company Service Area."

Q. And I'll represent to you, Mr. Barlogi, this was a document that was made an exhibit in the 2008 hearing. It was prepared by SPF Water Engineering on behalf of the Idaho Ground Water Appropriators. And it was looking at exactly what it says in the title; nonirrigated acres.

MR. THOMPSON: Mr. Director, I'm just going to lodge an objection, I guess, to prior exhibits contained in the underlying record in this case. I think it's unduly repetitious to have to go through this again. We did this once, we don't need to go through every exhibit that's already been part of the record and what the Department has considered in developing the methodology.

MR. BROMLEY: If I may respond?

HEARING OFFICER: Sure.

MR. BROMLEY: Well, Director, you know, we heard from the Court that this is an ongoing delivery call. We have heard -- and I'll get to the point with Mr. Barlogi with some foundation -- that he has a belief that subdivisions require more water to be applied.

I'm not talking about specific acres, but we can certainly get to there, Step 1 requires that. But what I'm trying to get at is use of water within subdivisions with an exhibit that's in the record in this ongoing delivery call to establish foundation with Mr. Barlogi about his opinions that subdivisions use as much or more water than an irrigated field.

HEARING OFFICER: So let me understand, Mr. Thompson. This document titled "Estimate of Non-Irrigated Acres Within Twin Falls Canal Company Service Area" is a document that was previously

submitted in a delivery call proceeding for the Methodology Order?

MR. THOMPSON: It was submitted in the 2008 hearing considered by the hearing officer, Justice Schroeder, at that time, part of the record for that proceeding.

HEARING OFFICER: So your objection is that this document shouldn't come into the record because it's already previously been considered?

MR. THOMPSON: That would be my objection.

HEARING OFFICER: Okay. I'll overrule the objection. I don't see harm in this document being in the record again.

Mr. Bromley, go ahead.

MR. BROMLEY: Thank you, Director. It already is part of the record, and we're trying to make it easier by pulling documents that are, in our opinion, helpful.

Q. (BY MR. BROMLEY) So, Mr. Barlogi, let's look at page 36.

MR. THOMPSON: Chris, Bates stamp, please?

MR. BROMLEY: As far as I know, it's 36, Travis. I don't see a Bates stamp on it. I see, at the bottom of Exhibit 171, dash, page 36. And it's page 36 on the PDF, too.

Q. (BY MR. BROMLEY) Are you there, Mr. Barlogi?
A. I am.
Q. And when I look at this, I see what, you know, I would call a typical subdivision with curbed streets and cul-de-sacs and roads.
Is that what you see?
A. I do.
Q. I see at the bottom it's called out as "Figure 6, Urban Subdivision 3 (North Pointe)"?
A. [Witness nods head.]
Q. Okay. So we're on the same page, then.
So in your deposition and in your direct testimony you stated that subdivisions require the same amount of water or more.
Do you recall that testimony?
A. I do.
Q. Is this your opinion as to subdivisions, or has Twin Falls Canal Company done any studies to prove this?
A. I would say currently this is not an opinion, this is a fact. As I told you in the conversation we had last week, if you develop land within the City of Twin Falls, they require that you have a share per acre.
So what my company does is when a water user calls and orders his water on, I'm obligated to turn on

the amount of water that he has, which is a share per acre.

Q. Okay. So have you done any studies that show that use of water in subdivisions -- so looking, again, at this page 36 -- with many fewer acres that cannot be irrigated, as you agreed with me previously, due to rooftops, streets, sidewalks, and such -- what studies do you have that show that use of water in a subdivision is more intensive than on an irrigated farm?

A. I don't think canal company -- this canal company doesn't do that kind of study, no.

Q. Okay. Thank you.

So on page 27 of your direct testimony -- and then Mr. Thompson gave us -- I think it's now marked 1A --

MR. BROMLEY: Travis --

MR. THOMPSON: Yes.

MR. BROMLEY: -- is that right?

Q. (BY MR. BROMLEY) -- which is this graph that Mr. Thompson had marked as Exhibit 1A.

It's now a loose -- yeah, we don't need to go into the binder. Helpful to pull that out.

So looking at Exhibit 1A, it seems to be, in what you were saying, that the company diverts at a fairly consistent rate of 1.1 million acre-feet;

correct?

A. Yes.

Q. And so I'll just represent to you, Mr. Barlogi, that if the company's diverting 1.1 million acre-feet for irrigation of 190,000 acres, the volume of water that's available per acre -- just simple math division -- is approximately 5.8 acre-feet.

Would you accept that as correct?

A. Yes.

Q. Thanks.

So if a subdivision reduces the irrigated area by half and Twin Falls Canal Company farmers are using up to 5.8 acre-feet -- that's what we were just discussing -- you're saying subdivisions are using at least 11.6 acre-feet?

A. I'm saying that they are entitled to the same diversion rate.

No, they are not using that. No, that's not what I'm saying.

Q. So if the irrigated area is half -- let's start it this way, if a 40-acre field is taking 5.8 acre-feet of water, the subdivision has contracted that space by half due to hardening of acres, only half of those acres are receiving the same volume of water, which would be 11.86 acre-feet; correct?

A. Yes.
Q. Let's talk about return flows, Mr. Barlogi. So you stated in your direct testimony, and we also discussed in your deposition, the Twin Falls Canal Company tracks return flows; correct?
A. Yes.
Q. And I'd like to just talk about what that's made up of. So when the company is tracking return flows, does that include local runoff?
A. To some extent.
Q. How about coulees?
A. As they are a part of our system, yes.
Q. Okay. And what about the tributaries?
A. I assume you're talking about Rock Creek, and we do not monitor those, no.
Q. But if those were monitored and water was going into them off of the project, that would be something that would be part of a return flow?
A. We monitor the location where the system spills into the tributary, not the tributary.
Q. Great. Thank you.
So at your deposition, you said you spoke with Matt Anders about the company's return flows to the Snake River below Milner.
Do you recall that testimony?

A. Yes.

Q. And in your deposition, you stated that Twin Falls was returning a significant percentage of water.

Do you recall that testimony?

A. No, I'm going to argue your words. I don't believe I stated that we were returning a significant amount of water. I think I said in my testimony that a pie chart that we had seen suggested that we were, off of our return flows, spilling significantly more water than we feel that we are.

Q. Okay. And thank you for correcting me on that, Mr. Barlogi. That's what I also see in your testimony, that you were having a discussion with Mr. Anders about what, in your words, he was looking at as a significant percentage, and you were having a discussion with Mr. Anders about you didn't think it was that much?

A. Yes.

Q. Whatever it was that Mr. Anders was showing you?

A. [Witness nods head.]

Q. So is it true that Twin Falls is returning in excess of 150,000 acre-feet per season?

A. I don't know. I don't know that I've totaled

it per season.

Q. Okay. And I'll represent to you -- and testimony will come in later -- but would it surprise you that Twin Falls Canal Company is returning in excess of 300,000 acre-feet per irrigation season?

A. Yes, I don't believe that number.

Q. Okay. Do you know if the return flow information that you discussed with Mr. Anders was incorporated into the Methodology Order?

A. No, I don't believe it had anything to do with it.

Q. And how many power plants are within Twin Falls Canal Company's boundary?

A. I would -- I'm going to throw a number out there and tell you ten.

Q. What was the most recent power plant that was constructed?

A. The most recent one is the Midway Power Plant.

Q. Do you recall when that was built?

A. Yeah, I want to tell you 2005, '6, '7-ish.

Q. Okay. And let's turn to Exhibit 338.

MR. THOMPSON: Mr. Director, before we start, I will object to this exhibit. I can explain why if you'd like.

HEARING OFFICER: Okay. Well, it's a

preliminary objection. I'll allow counsel to try to lay a foundation, and then I'll anticipate an objection forthcoming.

Mr. Bromley?

MR. BROMLEY: It was a deposition exhibit. I'll work through this.

Q. (BY MR. BROMLEY) Mr. Barlogi, you recall this exhibit?

A. I do.

Q. And at your deposition, you discussed this exhibit with Mr. Johnson [sic]; correct?

A. Yes.

Q. Okay. And you highlighted the power revenue in yellow; correct?

A. Well, I highlighted what I understand to be the power revenue. Typically, when I look through these documents, I have my accountant beside me.

Q. So you're aware of what this document is? You understand the document?

A. No, not thoroughly.

Q. So the yellow that you highlighted, what did you highlight? We discussed this at your deposition that you were highlighting revenue that the company was realizing from hydropower generation; correct?

A. Yes, that was the attempt, but we struggled as

we went through it and as we highlighted, but that was the attempt.

Q. So what were the struggles?

A. Well, for example, you can see Twin Falls Energy Midway reimbursement. We're not certain that that was revenue or whether that was expense that came back as a result of costs incurred.

Q. And your counsel can clean this up, I suppose, on redirect. We've produced this exhibit previously.

The more water the Twin Falls Canal Company returns, the more power revenue the company will realize; correct?

A. You know, our three big producers are South Forks Hydro, Midway Power, and Lower Low Line. Those are power plants that we own or are partners in. Those are the meat of all the income.

As I told you, there are probably another seven other projects in the system. We don't receive royalties from all of them. Some of them we do. They are privately owned. They are much smaller plants. And, yes, they exist on the tail ends or the returns of those drains. And so, absolutely, if there's more water there, they produce more, which makes our -- I believe we receive about half a percent from a base value as royalty from those.

Q. Thank you.

MR. BROMLEY: I'll offer Exhibit 338.

HEARING OFFICER: Mr. Thompson?

MR. THOMPSON: Yeah, I'll just object to the relevance, I guess. The economic issue has already been addressed by the Director. You know, if we want to get profit and loss statements from every water user, we can certainly do that. It's beyond the scope of this proceeding. Mr. Barlogi testified to the fact that they do receive income from hydropower operations incidental to the irrigation deliveries. Putting this type of exhibit in the record is irrelevant.

HEARING OFFICER: Mr. Bromley?

MR. BROMLEY: It doesn't have anything to do with the economic benefit between how much revenue a groundwater user would realize if allowed to stay on versus the economic benefit that a surface water user realizes by being able to stay on. That's the economic issue that's being discussed at Clear Springs. It's not this.

HEARING OFFICER: Mr. Barlogi, is this document a document from Twin Falls Canal Company records?

THE WITNESS: This document is a document that was created by our accountant; and yes, this is -- comes

from us.

HEARING OFFICER: Mr. Thompson, I agree with Mr. Bromley. The purpose of this is not to compare economic benefits or detriments from possible curtailment. My understanding is the purpose of this document is at least to show that there may be some incentive for additional diversions of water not necessary for irrigation, and, as a result, I'll receive it into evidence.

So the document marked as Exhibit 338 is received into evidence.

(Exhibit 338 received.)

MR. BROMLEY: Thank you, Director. And before I go on to the next topic, let me go back and let's offer and admit the exhibits that we've discussed.

So we had Exhibit 332, which were the headgate deliveries. This was the colorful document that showed three-quarters, five-eighths, half-inch. Offer that for admission.

HEARING OFFICER: Any objection?

Hearing no objection, the document marked as Document 332 is received into evidence.

(Exhibit 332 received.)

MR. BROMLEY: The next one that we talked about was Exhibit 334, which was a population graph of

Twin Falls County, with Mr. Barlogi agreeing with what the graph shows, which is the county has grown by 19 percent since 2020. I would offer that into evidence.

HEARING OFFICER: Any objection?

MR. THOMPSON: Yeah, I'll object to this exhibit. There's no foundation.

MR. BROMLEY: Well, Director, it's a document that's sourced off the internet with what says census data. That's kind of the best that we can do. Mr. Barlogi didn't disagree with me that Twin Falls County has grown.

THE WITNESS: Can I offer a comment?

MR. BROMLEY: No.

HEARING OFFICER: I'll receive the document into evidence. So the document marked as Exhibit 334 is received into evidence.

(Exhibit 334 received.)

MR. BROMLEY: Okay. That brings me up to current, Director.

Q. (BY MR. BROMLEY) Mr. Barlogi, I'd like to talk about irrigated area. So at your deposition, you said you were familiar with government programs like CRP and CREP that pay farmers money to fallow the fields.

Do you recall that testimony?

A. I do.
Q. And you stated that -- in your deposition testimony -- that the company doesn't keep track of acres that are enrolled in these programs; correct?
A. Yes.
Q. Wouldn't it be helpful for the company to know which acres are enrolled in these programs?
A. I am somewhat of the opinion that there are no acres enrolled in those programs on our tract or we would be aware of them.
Q. Okay. But in your deposition, you said that the company doesn't keep track of these acres. I suppose that's a different question than: Are there acres like that enrolled within the tract?
A. Yeah, I suppose it's relative. If there are no acres enrolled, then, no, we don't keep track of them.
Q. So your opinion is there are no acres enrolled in CRP or CREP within your tract?
A. That is my opinion.
Q. Let's say, though, that there were acres enrolled in those programs within the company's irrigation boundary. Don't you think it would be worth knowing that you have fallowed acres within the tract?
A. Certainly, if there were.

Q. And at your deposition, we talked about your familiarity with farmers who irrigate a field for a year or two, and then idle that field in order to rebuild soil health.

Do you recall that testimony?

A. No, I do not. I do not recall talking about fields that laid idle for a couple of years.

Q. You're not familiar with farmers who irrigate a field for a number of years, take the crop off, and let the field rehabilitate itself through nature by not having a crop on it for a year?

A. I am not, no.

Q. Wouldn't it be helpful for the company to know which fields are idled?

MR. THOMPSON: Objection; asked and answered.

MR. BROMLEY: The question I asked was as to CRP and CREP. The question I'm asking now, Director, is as to idling the fields.

HEARING OFFICER: I'll allow the question.

THE WITNESS: Assuming there were fields idled, of course it would.

Q. (BY MR. BROMLEY) So an idled field or a field enrolled in CRP or CREP has no water demand; true?

A. Again, I have no familiarity with lands that are enrolled in CREP.

Q. But if a field is idled, it's not being irrigated, it doesn't have a water demand; correct?

A. It certainly doesn't have a crop water need, yes.

Q. Does Twin Falls Canal Company keep track of strip malls, big-box stores, and industrial parks that have been built within the project boundary?

A. We do not.

Q. And isn't it true that acres that are hardened for commercial and industrial developments have no water demand?

A. No, not completely.

Q. And what is the water demand?

A. Many and most of the commercial developments still have some green space around them that has a water demand.

Q. So a rooftop, a parking lot, sidewalks, they're not receiving water; correct?

A. No.

Q. Mr. Barlogi, it was discussed during your deposition that you're familiar with the Department's requirement and the methodology, which is referred to as "Step 1," that the company state annually how many acres it's irrigating.

Do you recall that?

A. I do.
Q. And in your deposition you stated you didn't know how many acres Twin Falls Canal Company's irrigating; correct?
A. Yes.
Q. At your deposition, Mr. Budge, on behalf of IGWA, provided you with copies of each letter that the company has sent to the Department over the years regarding the company's irrigated area for purposes of the Methodology Order.
Do you recall that line of questioning?
A. Yes.
Q. And Exhibit 337 -- if you could turn to that -- do you recognize those documents?
A. Yes.
Q. And those are the documents that you went through with Mr. Budge; correct?
A. Yes.
Q. So if Twin Falls Canal Company doesn't keep track of the number of acres that it's irrigating, how is it that the company can provide the Department with an accurate count of the number of acres that are being irrigated each year?
A. We are required to represent whether or not our acreage has changed by more than 5 percent every

year. 5 percent of 194,000 is nearly 10,000 acres. It's very easily -- easy to know that we have not changed anything to the tune of 10,000 acres. We very carefully monitor transfers in water that moves within the project.

There are changes, there is development there, but 10,000 acres equates to about 15 square miles. There's been development in our area, but there hasn't been anywhere close to that kind of development in our area.

Q. You told me, Mr. Barlogi, that you don't know how many acres the company is irrigating; correct?

A. Yes.

Q. At your deposition, Mr. Barlogi, I asked you what the company's goals are in the delivery call.

Do you recall that question?

A. Not that specifically, no.

Q. And your answer to my question, Mr. Barlogi, was that the company has no goals.

Do you recall that answer?

A. So I don't specifically remember that specific question.

Q. Okay. I'm going to hand you, Mr. Barlogi, your deposition transcript.

MR. BROMLEY: If I may?

HEARING OFFICER: Yes.

MR. BROMLEY: Thank you.

Q. (BY MR. BROMLEY) Okay. Mr. Barlogi, that is the unsealed -- now-unsealed copy of your deposition transcript. I'd ask you to turn to page 57.

Are you on page 57?

A. I am.

Q. Line 7, I'm going to read.

"What are the surface water -- actually, let me ask it this way: What are Twin Falls Canal Company's goals in this methodology proceeding that we're in?"

That's lines 7 through 10.

MR. THOMPSON: I'll object to that.

Are you reading the deposition, or are you making up the question as you go?

What does it say, Chris?

MR. BROMLEY: I'm reading the deposition, Travis. Do you have the deposition transcript in front of you?

MR. THOMPSON: You said "Surface Water Coalition."

MR. BROMLEY: Travis, do you want to read it with me right here?

MR. THOMPSON: You changed it. I'm just curious --

MR. BROMLEY: No, Travis. I'm reading what the deposition transcript says. Why don't you come here and look at it with me.

MR. THOMPSON: No, that's fine.

HEARING OFFICER: All right.

MR. THOMPSON: I thought you said "Twin Falls Canal Company."

HEARING OFFICER: So do we have --

MR. BROMLEY: Travis --

HEARING OFFICER: -- an objection?

COURT REPORTER: Hey, guys --

HEARING OFFICER: Do we have an objection?

MR. BROMLEY: Come read it.

Q. (BY MR. BROMLEY) Do you see, Mr. Barlogi -- Sorry, Director.

HEARING OFFICER: I'm assuming the purpose of these questions are to either to refresh the memory of the witness or to impeach the witness, one or the other.

MR. BROMLEY: One or the other.

HEARING OFFICER: So let's read directly from the deposition.

MR. BROMLEY: That's what I'm doing, Director.

HEARING OFFICER: Okay. I don't have it in front of me, so I'm just, again, reminding you.

Q. (BY MR. BROMLEY) So, Mr. Barlogi, let's look

at line 7, page 57. And let's read along.

"Question: Okay. That's fine. What are the surface water -- actually, let me ask it this way: What are Twin Falls Canal Company's goals in this methodology proceeding that we're in?"

Would you please read your answer on line 14?

A. On line 14, I said: "I don't believe we have any goals" --

Q. Thank you.

A. -- "I don't believe it's our work."

But that is not the question that you asked me.

Q. So the question I asked you are what are the goals of Twin Falls Canal Company, which is --

A. In the surface water delivery call, that's the question you asked me here today.

Q. I'm asking you what Twin Falls Canal Company's goals are in this proceeding.

You just stated to me that you did not recall me asking you that question.

A. Because you didn't ask me -- you asked me what are the Twin Falls Canal Company's goals in the Surface Water Coalition call -- or in the -- you didn't ask me the same question that's in my transcript.

Q. So let's ask you that same question again

that's in the transcript.

What are your goals?

A. We don't have any goals. The methodology is not our product.

Q. Okay. So since Twin Falls Canal Company has no goals in the delivery call and since Twin Falls Canal Company doesn't know how many acres it's irrigating, how is it reasonable for Twin Falls Canal Company to curtail groundwater rights?

MR. THOMPSON: Objection; argumentative.

HEARING OFFICER: This is cross-examination. I'll allow the question to stand.

THE WITNESS: Again, you said we don't have any -- in the delivery call -- we do have goals in the delivery call. This is the methodology. That's not the question that I answered. The question is related to the surface water delivery call.

Q. (BY MR. BROMLEY) I would say it's one and the same.

Let's move on to the --

A. I would disagree.

MR. FLETCHER: I object. That's not a question, that's a statement. This is getting argumentative.

HEARING OFFICER: Okay. Well, let's move on.

MR. BROMLEY: I was moving on, Director.

HEARING OFFICER: Good.

Q. (BY MR. BROMLEY) Mr. Barlogi, I'd like to talk about Murtaugh Lake. You had mentioned that in your direct testimony again, with Counsel, this morning about how the system works.

Do you recall talking about Murtaugh Lake in your deposition?

A. I do.

Q. And you mentioned this morning -- you called it a "re-regulating reservoir." You also mentioned that -- some "recharge."

So when did Twin Falls Canal Company begin recharging in Murtaugh Lake?

A. So I'm going to guess. I think -- I think last year was, I want to tell you, maybe our eighth or ninth year of recharge. So I would say somewhere around, yeah, 2015-ish.

Q. Okay. So after we talked at your deposition, I went back and looked at the water right records of the Department just to see what the water right was that was going to go along with this recharge project. And what I found was a filing in 2020 that's numbered 45-14537. And that's an application filed by the company for recharge.

Does that sound about right?
A. Yeah. That's over my head. I don't --
Q. So let me hand you, Mr. Barlogi --
MR. BROMLEY: Director, if I might?
HEARING OFFICER: Yes.
MR. BROMLEY: So I think we're at Exhibit 363. Andrea, is that --
MS. KLAHN: 362.
MR. BROMLEY: 362?
MS. KLAHN: I don't think that -- yeah.
MR. BROMLEY: Okay. That one was -- you attempted to --
MS. KLAHN: Yeah, it wasn't in.
MR. BROMLEY: Okay. Should we mark this 362, then?
Let me mark this as 363.
(Discussion off the record.)
(Exhibit 363 marked.)
Q. (BY MR. BROMLEY) Just take a moment to familiarize yourself with that document, Mr. Barlogi.
A. Okay.
Q. All right. So I see when I look at this that it's an application for groundwater recharge. I see that in line 5.
Do you see that?

A. Yes.
Q. Okay. And it's from a source of Dry Creek, a tributary to the Snake River, in line 3?
A. Yes.
Q. Okay. And is this what we were talking about? This is likely the recharge right that you're using?
A. I think this recharge right came into play with it. I think we used Idaho Water Resource Board water right to recharge with.
Q. Okay. It's a document you filed with the Department for recharge, though; correct?
A. Yes.
Q. And I see on page 2 that you signed it?
A. Yes.
Q. That's your signature?
Do you know how much water is lost to seepage at Murtaugh?
A. I do not, off the top of my head, no. I mean, it is -- it is accounted for every year with the Idaho Water Resource Board recharge program.
Q. Okay. And I know, from experience with the board, that they're pretty particular about where they recharge. So I would assume it's probably a good amount that's lost, do you think?
A. Yeah, I think it's significant or they

wouldn't support it.

Q. So I see Dry Creek is listed as the source for this right; correct?

A. Yes.

Q. And I looked on a map, because I wasn't real familiar with the area, but what I was seeming to see is it looks like there's another source that comes in which is called Big Cottonwood Creek?

A. News to me.

Q. Okay. Yeah, the map had something coming in called Big Cottonwood Creek. If you don't know about it, I don't either.

Okay. And at your deposition, Mr. Barlogi, you said that since you've been recharging and when Twin Falls turns on for the irrigation season, you haven't had to fill Murtaugh in some years.

Do you recall that?

A. Yes.

Q. So Murtaugh, then, is -- it's filling with water from Dry Creek, some of that water is for irrigation, but then because Murtaugh Lake is filled when the irrigation season is starting in some of those years, that Dry Creek water is being used for irrigation; correct?

A. Yeah, I suppose so.

Q. There isn't a bypass channel around Murtaugh Lake from Dry Creek, is there?

A. No.

Q. So let's turn to page 2 of this document.

And I see in line 11, you say "see Attachment A" in a few places; and line 12, you see "Attachment A" in a few places.

Do you see that?

A. I do.

Q. Great.

So then when I go into Attachment A, and I go to the page that has some -- it's the second page in, so the first page of Attachment A looks like a legal description table. And then the second page, I see No. 10, "Supplemental Information," "11a & c, Supplemental Information."

Do you see that?

It would be on page 4 of the paper.

Yeah, there you go.

A. Okay.

Q. So in "11a & c Supplemental Information," three lines down, I see that it stated, "Twin Falls Canal Company as part of Carey Act filing 1900 that allowed for construction of these facilities."

Do you see that?

A. Yes, 11a & c.
Q. And then the page after that, there's a map of Murtaugh Lake; is that what that is?
A. Yes.
Q. And then the page after that, I see a document that's called "Contract."
Do you see that?
A. Yes.
Q. Okay. And this was attached by you to this document seeking a recharge water right at Dry Creek.
So on the -- and read to me what it says at the top of that document.
A. Of the contract?
Q. Yes.
A. It says: "Between State Board of Land Commissioners and Twin Falls Land & Water Company dated January 2nd, 1903."
Q. Thank you.
So I see a few headings on this first page. And then when I turn to the second page, I see some more headings -- the "Price of Water Rights" is one, "Water Right Dedicated" is another -- and I'd like to talk about the "Water Right Dedicated" piece.
And because that's pretty small font -- my eyes are getting worse the more of these that I do -- I

made a copy of -- trying to increase this so that people can read it.

HEARING OFFICER: So, Mr. Bromley, I'm trying to manage time a little closer today. How much longer do you have with Mr. Barlogi?

MR. BROMLEY: This is my last set of questions.

HEARING OFFICER: Okay. All right. Great.

MR. BROMLEY: Just five minutes, maybe.

HEARING OFFICER: Great.

(Exhibit 364 marked.)

Q. (BY MR. BROMLEY) Okay. Do you have Exhibit 364, Mr. Barlogi?

A. I do.

Q. Is that easier to read?

A. Yes.

Q. It is for me, too.

So let's look at this "Water Right Dedicated," and let's break it into parts. So starting at the word "Ninth."

Do you see that?

A. I do.

Q. And then from "Ninth" there's a colon, and then there's another colon after the word "to-wit."

Do you see that?

A. Yes.

Q. Okay. So at that second colon right after "to-wit," let's read from there. So starting with "One eightieth."

A. Okay.

Q. And would you read starting at "One eightieth"?

A. [As read] "One eightieth of a second foot allotted to each acre represented thereby, and carrying capacity of the canal sufficient thereof."

Q. Okay. So I'll represent to you that one eightieth of a cfs is the equivalent of five-eighths of a miner's inch.

So right after, then, you ended at "therefor." That was a perfect place to stop. Would you read from "the water to be delivered"?

A. "The water to be delivered from the canal during each and every irrigation season, said amount to be measured at or within one half-mile of the place of intended use in such quantities and at such times as the condition of the soil, crops and weather may determine but according to such rules and regulations based upon a system of distribution of water to the irrigators in turn and by rotation as will be best" -- "as will best protect and serve the interests of all users of water

from this canal system."

Q. Okay. And then read that last sentence, and that's the last of it I'd like you to read.

A. "It is agreed that said system of distribution by rotation shall be devised by the said party of the second part and used by it during the period while it retains the management of said system, and that it shall meet the approval of the State Engineer."

Q. Okay. Thank you, Mr. Barlogi.

So is the company measuring from one half -- or I should say at or within a half-mile of the place of intended use? Is that where you measure?

A. Yeah. Yeah. I would say by and large, yes, almost exclusively, yes.

Q. Great.

And then as to this system of rotation that you've stated and that you read in the last sentence, the company is not rotating; correct?

A. Well, I believe we are rotating. I would say this document was prepared in 1902. In 1902, a typical farm was 40 or 80 acres. That's not the case anymore. These farmers have all bought up the neighbors' farms and bought up the neighbors' farms to where the typical farm is now 800, 1,000 acres of those farms that, historically, per this document, were 40-acre farms, and

they are now rotating amongst all of those 40-acre farms. But it does all exist within one farm.

Q. And when we looked at -- well, let me say it this way: When we started at the beginning, maybe a little ways in, when I asked you how much water Twin Falls Canal Company is delivering this season, you said three-quarters of an inch; correct?

A. Yes.

Q. That's more than five-eighths?

A. Yes. I would also suggest that the time that this document was prepared, the system was envisioned to encompass 240,000 acres. That didn't come into fruition, but that's what we were decreed for, was the water for the 240,000. Since then we are down to 194; so, arguably, there's some balance there between five-eighths and three-quarters.

MR. BROMLEY: We could have some further discussion about the contract, but I'm going to leave it there, Director.

I would then move for the admission of these last two exhibits that we've discussed --

363 and 364, Andrea?

HEARING OFFICER: Any objection to the admission of these documents?

The documents marked as -- and, again, correct

me -- 363, is that correct, and 364, Mr. Bromley?

MR. BROMLEY: That is correct, Director.

HEARING OFFICER: -- are received into evidence.

(Exhibits 363 and 364 received.)

MR. BROMLEY: And then the one other one that I have on my list, just to clean up, is 337.

These were the letters, Mr. Barlogi, that we looked at that your counsel has sent in to the Department over the years as the irrigated area under Step 1 of the Methodology Order.

Director, I would offer those at this time.

HEARING OFFICER: Any objection to the admission of these documents?

Okay. The documents or document marked as Exhibit 337 is received into evidence.

(Exhibit 337 received.)

MR. BROMLEY: I have nothing further. Thank you.

HEARING OFFICER: Thank you, Mr. Bromley.

MR. BROMLEY: Thank you, Mr. Barlogi.

HEARING OFFICER: Let's break for 15 minutes. Let's come back at five to the hour.

(Break taken.)

HEARING OFFICER: We're back recording.

Okay. Next examiner, Mr. Bricker. Go ahead.

MR. BRICKER: Thank you, Director.

CROSS-EXAMINATION

QUESTIONS BY MR. BRICKER:

Q. Hello, Mr. Barlogi.

A. Hello.

Q. Nice to meet you -- or to see you in person.

I want to begin with some return flows. So does Twin Falls Canal Company track the entirety of its diversions that return to the Snake River above ground surface; in other words, spill back into the river?

A. Yes, in a manner of speaking.

Q. And the amount of the company's spills haven't significantly changed since 2010, have they?

A. No.

Q. Now, if the company were to take measures to reduce the amount of spills, thus, using that water before it leaves the system, couldn't the company thereby reduce its diversions?

A. Well, I think we do take measures to limit the amount of water that goes over those spills to the best extent possible. Operational spill is required at the ends of all of those laterals.

Q. Are there further measures that could be taken

to reduce them further?

A. If there are and we haven't already undertaken those measures, it's because we haven't identified them yet, and we certainly would if we saw them. We do everything we can to minimize the amount of spill.

Q. Fair enough.

All right. Does Twin Falls Canal Company want the Fifth Methodology Order to accurately represent its reasonable in-season demands?

A. Well, certainly, I would think so.

Q. Can we pull up Exhibit 1, that's your prefiled testimony. And while we're at it, also Exhibit 300, which is the Fifth Methodology Order.

So beginning with your prefiled testimony, can you please turn to page 27 of Exhibit 1.

A. Okay.

Q. On lines 8 to 14 therein, you state that the company's diversions have stayed around 1,100,000 acre-feet per year over the last 30 years; right?

A. Yes.

Q. But that's not consistent with the data presented in the Fifth Methodology Order on page 12, is it?

MR. THOMPSON: I guess I'll object to the form

of the question as those two pieces of information representing the same time periods. I don't think they do.

HEARING OFFICER: Well, I'll at least sustain the objection.

Mr. Bricker, just asking for more foundation, looking at the information in the Methodology Order.

MR. BRICKER: Sure.

Q. (BY MR. BRICKER) So isn't it true that the company's diversions from 2000 to 2021 averaged 1,062,098 acre-feet?

A. I assume so. I haven't done that math myself, but that's what the document says.

Q. And that number is, roughly, 38,000 acre-feet less than what you claim the company's annual diversions to be around?

A. No, I don't believe that's accurate. I believe I clearly state that it is right around 1.1 million. Some years a little less; some years a little more.

Q. Okay. But the Fifth Methodology Order states that the average diversions are 1,062,098 acre-feet?

A. Okay.

Q. Thank you.

Now, isn't it true that the Department uses

the company's 2018 diversions as the baseline in predicting the company's reasonable in-season demands?

A. You've got to restate that. Say it again.

Q. Isn't it true that the Department uses the company's 2018 diversions as the baseline for the company's reasonable in-season demand?

A. I believe that's accurate.

Q. Isn't it true, on page 12, that the company's baseline year demand under the Fifth Methodology is 1,121,717 acre-feet?

A. That's what it says in the book, yes.

MR. BRICKER: Can we pull up Exhibit 306, please.

Q. (BY MR. BRICKER) Do you have it?

A. Yes, sir.

Q. Also on page 12, please.

Isn't it true that the company's baseline year demands under the Fourth Methodology Order were quantified as 1,060,011 acre-feet?

A. Yes, sir.

Q. Isn't it also true that the company's baseline year demands under the Second Methodology Order were quantified as 1,045,382 acre-feet?

MR. BRICKER: And I realize this is not in an exhibit before us, but I would ask the Director to take

official notice of that Second Methodology Order.

HEARING OFFICER: I don't have it in front of me, Mr. Bricker. It certainly is part of the record. So whatever numbers are there, you know, I'll review if there's a need to do it.

Q. (BY MR. BRICKER) Well, I will represent to you that under the Second Methodology Order Twin Falls Canal Company's baseline year demands were quantified as 1,045,382 acre-feet.

Do you have any reason to deny that?

A. No.

Q. So isn't it true that the Department has increased Twin Falls Canal Company's baseline year demand by over 76,000 acre-feet since the Second Methodology Order?

I can read the numbers to you again if you'd like.

A. Well, I mean, I'll agree. That is somewhere around where the difference between those two numbers is, yes.

Q. Great. And the Department -- excuse me. Let's turn to Exhibit 301, page 3.

Isn't it true that the Department is predicting a shortfall for Twin Falls Canal Company in the magnitude of 75,200 acre-feet in 2023?

A. Yes.
Q. Isn't it also true that under the Second Methodology Order there would not be a shortfall predicted in this year, assuming that same baseline year demand?
A. I assume so. I have not done that math, I guess. I assume so.
Q. Great. Now, you've stated in your deposition that everything Twin Falls Canal Company does is in the interest of efficiency; is that correct?
A. Yes.
Q. And you've also stated that Twin Falls Canal Company's operations have absolutely become more efficient in the last two decades; correct?
A. Yes.
Q. And that's because the company has undertaken many projects, including lining canals and implementing automation into its operations; right?
A. Yes. Among other things.
Q. Turn back to Exhibit 300, please.
And I don't know if it's possible, but could you also have Exhibit 306 side by side?
MR. WOOD: What is the one that you want?
MR. BRICKER: Exhibit 300 and Exhibit 306.
MR. WOOD: What page?

MR. BRICKER: Page 14 in both.
MR. WOOD: Page 14?
MR. BRICKER: Correct, in both.
MR. WOOD: So here will be 306.
Q. (BY MR. BRICKER) Have you got those, Mr. Barlogi?
A. I do.
Q. Okay. So isn't it true that your assertion that Twin Falls Canal Company's project efficiencies have increased is not consistent with the difference between Twin Falls Canal Company's project efficiencies shown in the Fourth Methodology Order and the Fifth?
A. No, I don't, necessarily, believe that is true.
Q. If you look at those two tables, is Twin Falls Canal Company's project efficiency .35 in both?
A. Yes, it is.
Q. Thank you.
As we discussed a few minutes ago, the Department has predicted that the canal company will experience a shortfall in 2023; correct?
A. Yes.
Q. And the Department has predicted shortfalls in past years as well; correct?
A. Yes.

Q. Now, in your deposition, isn't it true you stated that it is not common for Twin Falls Canal Company shareholders to forgo planting crops because of a lack of water supply?

A. Yeah, I don't know if I said it quite that way or not. I would say that, typically, we have -- in my lifetime at the canal company, we have had more good water years than bad ones.

So, yeah, certainly. Typically, they don't forgo planting the crops that they would like to plant because, typically, we have a decent water supply.

Q. And, similarly, you've stated that you are not familiar with crops perishing within the canal company's project area because of inadequate water supply; correct?

A. No, I'm not.

Q. Could you turn to Exhibit 314, please. That's going to be page 224.

A. Okay.

Q. Do you see line 18 says, "I'm not familiar with crops perishing"?

A. Yes.

Q. Thank you. A few more questions.

You have stated that you haven't experienced Twin Falls Canal Company shareholders idling their land;

correct?

A. Yes.

Q. You also stated that there's typically a zero percent change in TFCC's irrigated acreage; correct?

A. Yes.

Q. So that must mean that the company must be -- the project area of the company must be planted wall to wall, then, each year; right?

A. No.

Q. Can the company ascertain when certain lands are not irrigated in a given year?

A. Well, certainly, I think -- I think we would know, yes.

MR. BRICKER: Thank you.

No further questions, Director.

HEARING OFFICER: Okay. Thank you, Mr. Bricker.

Further questions, Mr. Budge?

MR. BUDGE: Thank you, Director.

CROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. And thank you, Mr. Barlogi, for being here today.

Do you mind if I call you "Jay"?
A. No, that's fine.
Q. Jay, I'm going to try to avoid duplicating other questions you've been asked, but I do have a little overlap just because I want to clarify a few items.
First, you testified earlier about different delivery rates of the company, three-quarters of an inch per share and five-eighths-inch delivery.
I just want to clarify, that's per share of stock?
A. Yes.
Q. Twin Falls Canal Company does not deliver water on a per-acre basis; it's a per-share basis?
A. Yes.
Q. And I understand from your direct testimony, there's 202,690 total outstanding shares in the company?
A. Yes.
Q. And if we've got somewhere between 180- and 194,000 irrigated acres, we end up with somewhere around 1.1 share per acre on average?
A. Okay.
Q. In your prefiled testimony, you discussed the challenges that development is causing for your company, specifically the changes of farmland from ag into

residential, commercial, and industrial use.

Do you remember that part of your testimony?

A. Yes.

Q. This is something I'm sure you've witnessed firsthand during your time with the company?

A. Yes.

Q. And you're personally familiar with farmland that used to be irrigated that now has got commercial or industrial development on it?

A. Of course.

Q. Has this transition happened relatively continuously during your time with the company?

A. No -- well, yes, at some level there's always been something going on. Certainly, in the earlier years very little. In the last couple of years, as the economy has been so fluid, a lot more.

Q. Okay. So probably fair to say it's accelerated in the last decade or so?

A. Fair.

Q. I understand Twin Falls Canal Company has three irrigation water rights. The water right numbers on file with the Department are 1-209, 1-4, and 1-10.

Are you familiar with those water right numbers?

A. No, I'm not.

Q. Maybe what I'll have you do, Jay, is turn briefly to Exhibit 184.

A. Okay.

Q. And you can take a moment just to briefly review that document and the attachments.

Jay, have you had a chance to review that?

A. Yeah, briefly.

Q. That's a document filed in the Snake River Basin Adjudication. There's a joint stipulation to withdraw objections, and then there's some water right recommendations for Water Right Nos. 1-4, 1-10, and 1-209.

A. Okay.

Q. Do you recognize those as Twin Falls Canal Company's irrigation water rights from the Snake River?

A. These are our natural flow water rights from the Snake River, yes.

Q. Okay. And you understand that, collectively, those three water rights authorize the irrigation of 196,162 acres?

A. No, I don't know that, but...

Q. Okay. If you'll look at the second page of the exhibit, which is part of the stipulation, there's paragraph 3(a), and it reads, "Evidence relating to water right use after November 19th, 1987, was not at

issue in the adjudication. These water rights are decreed in the Snake River Basin Adjudication based on the extent of beneficial use that existed prior to or at the time of the commencement of the Adjudication on November 19th, 1987.

Do you see that?

A. I do.

Q. Do you understand that the decrees issued by the SRBA are based on the extent of irrigation in 1987?

A. Yes.

Q. And you would agree that there's been a significant number of acres removed from irrigation since that time?

A. No -- well, yes, significant is somewhat relative, but I would say that certainly for some of these industrial complexes, they retained 25 percent of their water shares, and the other 25 -- or the other 75 percent were transferred to otherwise drylands.

Q. Okay. So as development has occurred, some land has been taken out of production, and some shares have been transferred to other farmers?

A. Yes.

Q. I understand.

I think you went over some of this with Mr. Bromley, but I just wanted to make sure it's clear

for me in the record. Twin Falls Canal Company does not maintain a record of the number of irrigated acres that it delivers water to annually?

A. No.

Q. So when farmland is developed or removed from production, there's not some book or other database that the company maintains to, you know, reflect that land being taken out of production?

A. Say that again, TJ.

Q. When farmland is developed and taken out of production, the company doesn't maintain any type of database where it keeps track of that land being taken out of production?

A. You know, I would suggest that some of that is likely in the Magic program that I talked about before. I'm not intimately familiar with the Magic program, but I do know that, you know, section-township-range information is there. So if we transfer water from one area to another, that certificate reflects that new section, township, and range. I believe you will find that in the Magic program as well.

Q. So you've got something that shows that -- if shares move from one delivery point to another?

A. Certainly, we track the shares.

Q. But you're not tracking the acres being taken

out of production?

A. No.

Q. Some Surface Water Coalition members maintain a GIS shapefile that they update annually with irrigated acres. That's not something that Twin Falls Canal Company does?

A. No.

Q. If you could turn to Exhibit 300 -- that's the Fifth Methodology Order -- and when you get there, flip to page 9.

A. Okay.

Q. Jay, have you read the Fifth Methodology Order before?

A. Yes.

Q. On page 9, there's a heading near the bottom titled "Irrigation Practices"?

A. Yes.

Q. And below that, there's a paragraph 19 referring to the baseline year, and it says, "A baseline year must be recent enough to represent current irrigation practices. Current conditions should be represented by (a) the net area of irrigated crops," and then I won't read the rest.

Do you understand that the methodology utilizes irrigated acreage to calculate water demand for

Twin Falls Canal Company?

A. Yes.

Q. You understand that if Twin Falls Canal Company reports to the Department more irrigated acres than are actually irrigated, then the methodology will calculate more water demand than if the correct number of acres were used?

A. Yes.

Q. And that this will result, in turn, in additional curtailment of groundwater users or additional mitigation being required of groundwater users?

A. Yes.

Q. So you understand that having -- the Department having accurate acreage figures is very important to ensure that the Department does not impose excess curtailment?

A. Yes, I do.

Q. Okay. And you understand that groundwater users don't have access to Twin Falls Canal Company's water delivery database?

A. Yes.

Q. Okay. So you understand that groundwater users have to trust that Twin Falls Canal Company will provide accurate acreage data to the Department?

A. Yes.
Q. And I believe you testified earlier that you don't think the irrigated acres within Twin Falls Canal has varied by more than 5 percent since the 2013 figure?
A. Yes.
Q. But there's not a mechanism in place to track total irrigated acres with the company?
A. No.
Q. So in the future if it exceeds that threshold, the company won't really know when that happens?
A. Well, I disagree with that. I believe we would know. It's a large enough number that we certainly would know. The reason we haven't created shapefiles in recent years is because we know for certain that we are within the 5 percent very, very easily.
Q. And how do you know that for certain?
A. Again, as I represented earlier, 5 percent of 194,000 is nearly 10,000 acres, nearly 15 square miles. Nothing close to that has happened.
Q. Let me reference -- I'm going to switch gears here and reference a portion of your prefiled testimony that talks about crops grown within the company's service area.
And you mentioned there's wheat, barley,

alfalfa, sugar beets, potatoes, dry beans, and corn.
I assume those are the primary crops?
A. Yes.
Q. Anything else would be on a small scale?
A. I'm sorry, I wasn't tracking everything that you said.
Q. Yeah. There may be some other greenhouse-type crops or something grown, but they would be very small?
A. Yes.
Q. What's your best estimate as to the percentage of the company's service area, on average, that's used to grow wheat and barley?
A. I don't have any idea.
Q. Is it a significant portion?
A. Yeah, yeah, I would say so.
Q. And I'm not a farmer, but I understand those crops are typically harvested in early August?
A. Yeah, I'm not a farmer either, but, yeah, I think you're right.
Q. And so when those crops are harvested, there would be a drop in irrigating acreage within the company's service area?
A. Not necessarily.
Q. Do those acres that were growing barley and wheat continue to be irrigated after they're harvested?

A. To some extent they do. A lot of times, the guys will irrigate the stubble to assist in the soil health to help the stubble break down. In recent years, we've seen some double cropping going on on the project. Furthermore, those acres that were under barley, that water has probably now been moved off of those acres and rotated around to the sugar beet crop or to the alfalfa crop or to the corn crop.

Q. Is it fair to say that the amount of irrigation that was occurring -- that occurs on wheat and barley acres declines on those acres collectively after those crops are harvested?

A. Yeah, I would say after a period of time, you know. Commonly during that time of year, every crop out there is needing water. So when the grain crops are done, it's very, very common for two or three weeks to see water users attempt to get caught up in areas where they were behind.

Once they begin to get caught up, if they had enough grain on their farm, you will see them reduce their delivery.

Q. And you explained earlier that the company doesn't do rotations, but individual stockholders can rotate their water supplies among their different fields on their farm?

A. Yes.
Q. Do most farmers take their diversion rate continuously through the irrigation system but have that type of rotating you discussed earlier?
A. Yes, more or less.
Q. And I understood from your deposition that the company, typically, delivers water from mid-April to mid-October?
A. We, typically, have water available for delivery from mid-April through mid-October, yes.
Q. And I understood from your deposition testimony that stockholders tell you in the spring when they're ready to turn on, and they tell you in the fall when they're ready to turn off?
A. Yes.
Q. I understand that Twin Falls Canal's water supply depends primarily on natural flow?
A. Yes.
Q. And when natural flow is sufficient to divert the full authorized diversion rate, I assume the company's going to take its full rate?
A. Well, likely. Likely -- I say that because, you know, 170 -- 170 cfs of our water right is a 1939 water right. And that water right is never available when you get into July, which leaves us at 3,600 cfs

with a 1915 of 600 and a 1900 of 3,000. So, typically, our system maxes out at 3,650. So throughout the June, July, and August period, you can expect to see those kinds of numbers with our diversion; and if the natural flow will sustain that, absolutely, we will divert it and need it.

Q. Yeah. Okay.

I assume from a canal management standpoint, it's easier to manage the system and get water to everybody with the full 3,600 cfs diversion than if you had to cut back to 3,000 or something like that?

A. Yeah, certainly. Yes.

Q. You testified a little bit today and in your deposition about all the work Twin Falls Canal Company has done to make its system more efficient.

A. Yes.

Q. In your deposition, you explained that you've installed a lot of automation. I think you mentioned there were 60 automated sites now within the company?

A. Yes, ballpark.

Q. You explained that the Kinyon Pond was constructed in 2012 or '13, which enables you to manage the water supply more efficiently?

A. Yes.

Q. You described a large canal lining project on

the High Line Canal in 2019?

A. Yes.

Q. And two large-scale projects -- lining projects planned for 2023 and 2024?

A. I think we have one planned, not two.

Q. Oh, one planned. Okay. I may have misunderstood that.

And you also explained that if funding were available, Twin Falls Canal would develop additional project efficiencies?

A. We are always looking for opportunities.

Q. And so if groundwater users were willing to fund an engineering study to identify additional efficiencies available to the company, is that something you would welcome?

A. I wouldn't say we would at this point, no.

Q. If groundwater users were to fund actual improvements that had been identified, would you welcome their support?

MR. THOMPSON: I'm going to object to this line of questioning going beyond the scope of this proceeding, relevance.

HEARING OFFICER: Mr. Budge?

MR. BUDGE: I think it's well within the scope of the proceeding.

HEARING OFFICER: Well, I'm torn, but I think I'll sustain the objection, Mr. Budge.

Q. (BY MR. BUDGE) Let me ask just a few follow-up questions about sprinkler efficiencies.

I think we covered some of this, but if I understood correctly, the company's gone from about 25 percent sprinkler to 50 to 60 percent sprinklers in the last 10 or 20 years?

A. That's our current estimate, yes.

Q. And when shareholders irrigate with sprinklers, they divert less water from the canal?

A. No.

Q. They apply just as much water per acre with sprinklers as they did with flood irrigation?

A. As I mentioned earlier, I'm not a farmer, I don't really know how they apply at all. I know that we continue to deliver the same amount.

I think on-farm efficiencies are certainly there. I think they have the ability to water their crops more efficiently, make better use of the water on the farm, and then move that water around to other crops.

Bear in mind, on our system one farmer is not growing just one great big hayfield. He's got hayfields. He's got cornfields. He's got grainfields.

So he may be able to more efficiently move his water around on his farm, but he still has a right, and we still deliver the same amount.

Q. You testified at your deposition that with the conversion from flood to sprinkler, there's less water that's accruing to waste ditches throughout the company?

A. Yes. Actually, I -- yeah, you know, the on-farm improved efficiencies, I believe, are there. The on-system efficiencies suffer.

Q. So when you say you deliver the same amount, what you're saying is you're making available to the stockholder the same amount of water, the three-quarters of an inch or five-eighths of an inch?

A. Yes.

Q. Does the company maintain meters at each delivery point to regulate how much water is diverted at each diversion point?

A. Yes, sir.

Q. And do those have totalizers on them?

A. Our meters are in the form of a concrete headgate that's measurable. They're not -- they're not electronic meters.

Q. You've got measuring devices, but not something that's keeping track of the total volume delivered --

A. No.
Q. -- each year?
Okay. But -- well, let me ask you this: In your prefiled testimony, you have a statement that there's less return flow into the system from flood irrigation, and as a result -- and here's a quote -- "We simply have to bring more water into the system to supply those needs."
Do you remember this part of your testimony?
A. Yeah, I remember that conversation and multiple parts of my testimony.
Q. And I'm referring to your prefiled testimony that's been admitted as Exhibit 1, I believe. And that's page 22, line 20.
A. So I would say that following that I believe there's a sentence that says that's simply not possible to just go get more water. We look at efficiencies and canal capacities as virtually synonyms. Our canal capacity doesn't allow us to just continually go to the head and get more and more water.
So we've had to become more and more efficient in order to meet with those needs and meet with the deficit that we now experience because we don't receive that wastewater to redeliver time and time again.
Q. Now, your testimony is that when somebody

converts from flood to sprinkler that wastewater diminishes, but they're diverting just as much onto the fields as they did with flood irrigation?

A. Yes.

Q. Okay. So with flood irrigation there's water that would discharge into waste ditches. Some of those waste ditches return to the company's system, and others just discharge out of the system; correct?

A. Yes.

Q. So when somebody converts from flood to sprinkler, and there's less wastewater discharging out of the system, there's no water savings there for the company?

A. No. There's a water shortage that exists as a result of that.

Q. So converting to sprinkler -- what you're saying is it actually takes Twin Falls Canal Company more water for its patrons to irrigate their crops with sprinkler than with flood?

A. No. I'm saying it takes the company a higher level of efficiency to operate with sprinklers versus flood.

Q. So less water?

A. The same.

Q. The same water? No difference?

A. Right. 1.1 million.
Q. Diverts the same at the head, is what you're saying?
A. Yes.
Q. So if the whole company was in sprinkler, you would still want to divert the full 1.1 million acre-feet at the head?
A. We will strive to improve our efficiencies so that we can do that. As we lose that wastewater, it becomes a challenge.
Q. Let me ask you a few questions about subdivisions.
You mentioned that subdivisions use as much water as the farmer used before the subdivision went in?
A. Yes.
Q. In your testimony, your prefiled testimony, you reported that most subdivisions divert most or all of their water between 5:00 and 10:00 a.m.?
A. No. I think they use most of their water between that. They divert it constantly.
Q. Where does it go when they're diverting it but not using it?
A. Back into our system or back into its historical waste path.
Q. Okay. So they divert it, they just don't use

it to grow landscaping and sod and stuff like that?

A. Right.

Q. So when you say subdivisions continue to divert just as much as before, the diversion hasn't changed, but the amount of crops grown -- considering sod a crop, that goes down. The amount of -- I'll do it this way: The amount of acres irrigated goes down, but the diversion stays the same?

A. Yes. There's hard-surface areas in there that aren't growing a crop.

Q. And then additional water comes back into the system through a waste ditch or whatever?

A. Yeah, it either comes back into the system or it goes back into a historical waste path and wastes beyond our system into the Snake River Canyon, the Rock Creek Canyon. Or in many cases they have built large storage ponds to store that capacity so that when the sprinklers all fire up at 5:00 o'clock tomorrow morning, there's been capacity built in order to sustain that need.

Q. Okay. Very good.

I've just got a few more questions, and it's about the hydropower facilities, and you covered some of this with Mr. Bromley.

I understand there's three facilities that

Twin Falls Canal Company is an owner and part-owner. It's Midway Power, Lower Low Line, and Twin Falls Energy.

Are those the three?

A. No. It's Midway Power and Lower Low Line we fully own, and we're partners in the South Forks Hydro.

Q. That's right. You explained that in your deposition, and I didn't get it straight. I apologize.

And then there's another seven plants that are owned by third parties?

A. Yes.

Q. You testified earlier today that most of these are at the tail end of drains?

A. Yes.

Q. And on some of the plants that Twin Falls doesn't own, they receive royalties from the third-party owner?

A. Yes.

Q. And I believe in your deposition you testified that Twin Falls has budgeted $1.8 million from hydropower revenue in 2023?

A. There is that kind of revenue expected, and there are expenses associated with that as well.

Q. Okay. And that's just for the three plants that the company has ownership interest in?

A. No, I believe that's all of it.
Q. That includes the other plants as well?
A. I believe so.
MR. BUDGE: That's all the questions I've got. Thanks.
HEARING OFFICER: Thank you, Mr. Budge.
Further questions from the groundwater group?
Redirect, Mr. Thompson.
MR. ANDERSON: Director, may I ask just one quick question? I'm sorry.
HEARING OFFICER: Of whom?
MR. ANDERSON: Of Jay. Sorry.
HEARING OFFICER: Sure.
MR. ANDERSON: Just real quick.
HEARING OFFICER: Yep. Come forward.
MR. ANDERSON: And I just will be quick.

CROSS-EXAMINATION

QUESTIONS BY MR. ANDERSON:
Q. I understand the objection and the sustaining of relevance on the question that was asked about technologies and efficiencies.
So my question is not what you would do or what you would allow groundwater districts to do, but I want to ask the question this way: Is there currently

factors or barriers to putting in new technologies into your system if those technologies existed?

A. No. We explore and entertain any new technology that comes along.

That being said, it's not all based -- all that it's cracked up to be.

Q. So other than the limitations of the technology itself, probably, there's no other factors, that you can think of, that would limit those technologies going in?

A. No.

MR. ANDERSON: Thank you. No further questions.

HEARING OFFICER: Thank you. Mr. Thompson.

REDIRECT EXAMINATION

QUESTIONS BY MR. THOMPSON:

Q. Mr. Barlogi, just a couple of questions on redirect here.

Can you turn to Exhibit 1. It should be in our small binder there in front of you.

A. Okay.

Q. Can you turn to page 22, please.

A. Okay. I am there.

Q. It's -- in lines 18 to 20 we have an objection

from the groundwater users as hearsay.

Can you just describe what you're discussing there?

A. Yes. I was just discussing the situation that we're talking about. As Twin Falls Canal Company has the opportunity to reuse each drop of water time after time after time as much of our -- all of our High Line ground, about 73,000 acres, wastes back into the Low Line. So all of that wastewater we get to recapture and reuse again. And then we deliver it, then, again, onto Low Line grounds that typically waste off of one farm back into our system. And we get to use it again and again and again.

It's part of our efficiency number within the company. And I was just citing a historical statement in one of the old documents of the canal company where a state engineer had made the comment that a drop of water is thoroughly exhausted by the Twin Falls Canal Company by the time they are done with it.

Q. So I guess you wouldn't have to rely upon that engineer's statement to know how that operation works?

A. No. Of course not, no.

Q. And do you also receive water from seeps and drain tiles?

A. Yes, sir.

Q. And what have you witnessed in regards to those flows, over time?

A. Well, seeps and drain tiles were installed originally between, I want to tell you, 1915 and 1930. We captured a huge amount of subsurface water and redirected it back into our system.

In recent years, certainly, that water supply has gone down, down, down. And the trajectory is still currently downward. We've seen a reduced amount of that water coming out of those seep tiles and tunnels.

Q. You heard some questions this morning about the hydropower projects within the canal company.

Does the canal company divert water from the Snake River only for hydropower purposes?

A. No. It's explicitly understood amongst all of our stockholders and amongst all of the power folks that those facilities exist incidental to irrigation demand.

Q. Can you turn to Exhibit 338.

A. I'm there.

Q. It's your testimony that these are annual income statements prepared by your accountant?

A. Yes.

Q. And would you agree that these statements do not show the company's annual expenses?

A. Yes, I would agree.

Q. And what are the company's annual expenses as far as an amount?
A. An amount?
Q. Yes.
A. Oh, for our total annual budget?
Q. Correct.
A. It is right between 7 and $8 million this year.
Q. Mr. Bromley went through the attachment to the company's groundwater recharge water right application; it was a 1903 contract.
Do you remember that testimony?
A. Yes.
Q. You talked with Mr. Budge about the water rights the company has decreed, 1900 right for 3,000 cfs.
So if that contract identified a water right for 3,400 cfs, what did the company actually get decreed over time?
I guess if there's a difference between your decree and that contract, what do you understand is your water right today?
A. Well, I understand my water right to be 3,780 cfs of natural flow in the river with various states with my 245,000 acre-foot of storage water

stacked on top of that.

Q. And I'll just focus on the 1900 water right. Is it your understanding that the 1900 priority right is for 3,000 cfs; is that correct?

A. Yes.

Q. So if that contract identified 3,400, that would be inconsistent with your water right; is that true?

A. Yes.

Q. Can you turn to page Exhibit 314. I think that's your deposition transcript.

A. Okay.

Q. Page 224.

A. Okay.

Q. I think Mr. Bricker asked you about crops perishing, and you read, I think, that answer on line 18; is that correct?

A. Yes.

Q. Can you read the rest of that answer, please.

A. From line 18: "Answer: I'm not familiar with crops perishing. I am familiar with complaints of reduced yields. Again, an inability to plant the crops that they would like to plant because they know it's going to be a short water year, so they go heavy on the grain, heavy on the wheat, heavy on the barley, and

forgo the corn and the high-priced alfalfa."

Q. I guess one last question, Mr. Barlogi. In terms of canal operations and efficiency, would you agree that the irrigated acreage within your project is not the only variable that affects that efficiency?

A. Absolutely.

MR. THOMPSON: That's all the questions I have. Thank you.

HEARING OFFICER: Thank you, Mr. Thompson.

Recross by anybody in the groundwater users group?

Mr. Budge?

RECROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Mr. Barlogi, Mr. Thompson was just talking to you about how farmers utilize their water. You testified earlier that you're not a farmer and not intimately familiar with their irrigation practices?

A. [Witness nods head.]

Q. And your testimony just given a moment ago was that the farmers go heavy on the wheat and barley until they're harvested and then move that water to the corn and the sugar beets and things like that?

Was that your testimony?

A. Just now?
Q. Yeah.
A. No, I don't think that was the intent of that conversation. Are you talking about the conversation I just had with Mr. Thompson?
Q. Yes.
A. No, I don't think -- I think that's out of context.
Q. Okay. I must have misunderstood.
Is it your testimony that while a farmer is growing their barley and wheat, they irrigate their corn and sugar beets and potatoes less, and then once the grain and wheat is -- the barley and wheat is off, then they irrigate them more at that point?
A. That is not the -- that is not the conversation that Travis and I just had, no.
Q. Okay. So just so I understand -- and you would agree that the cash crops are the corn and the hay and the sugar beets, things like that?
A. [Witness nods head.]
Q. And so it's not your testimony that the farmers are, you know, shorting those crops' water until the wheat and barley is off; you're just saying once the wheat and barley's off, there's just that much more water that they can put on their other crops?

A. My testimony was that farmers forgo the planting of corn and potato acres because they know it's a short water supply year, and they plant more grain and more barley and forgo those acres of going into the more valuable crops of alfalfa and corn.

Q. You don't really know what the individual farmer's rotations are on Twin Falls Canal's system because you're not involved in their farming practices?

A. I know from a general perspective, but not intimately with each farmer, no.

Q. You know from hearsay?

A. Well, from hearsay and from -- I mean, you can see it from the road. When it's a big grain year because it's a short water year, you can see noticeably more grain on the project, noticeably less corn and alfalfa.

MR. BUDGE: Yeah, Director, I would move to strike the testimony about farmers' crop rotation practices. This witness is not qualified to testify why farmers grow one crop versus another.

HEARING OFFICER: I'll deny the motion to strike. My impression is that Mr. Barlogi man ages and observes what's happening out there. He may not know exactly field to field because he's not a farmer, but, nonetheless, he has sufficient exposure that his

testimony should be considered. Thank you.

Q. (BY MR. BUDGE) Mr. Barlogi, you understand that commodity prices vary from year to year?

A. Certainly.

Q. And that commodity prices may drive farmers' decisions to grow one crop versus another?

A. Certainly.

Q. Do you understand that certain types of crops must be rotated with other crops to maintain soil health?

A. Certainly.

Q. And certain crops are grown based on contractual obligations to food producers?

A. Certainly.

Q. And you don't know why a given farmer may grow one crop versus another crop from year to year?

A. Not from those perspectives that you just mentioned, no.

Q. Okay. And then just one follow-up question about the conversion from flood to sprinkler, which I'm still struggling to wrap my mind around.

Do you understand when somebody irrigates with flood irrigation, there's excess water on the field and that excess water either sinks into the aquifer or it drains off into a waste ditch?

A. Yes.
Q. And when somebody irrigates with sprinkler, there's much less or maybe no excess water that runs off or sinks into the ground?
A. Yes.
Q. But your testimony is that the sprinkler farmers in your company's service area divert just as much water from the canal as happened under flood irrigation?
A. Yes.
MR. BUDGE: Okay. Nothing further.
HEARING OFFICER: Further questions by the groundwater group?
All right. Our timing seems to be very good again today. It's noon. Are we finished with Mr. Barlogi, then?
Mr. Barlogi, you can go back to --
MR. THOMPSON: Yeah, just a quick question on that. I'd like to release him. We did have certain parties identify him as a witness. I assume all of his testimony has been taken this morning; he can go home?
THE WITNESS: Okay. Thank you.
HEARING OFFICER: So the question is whether Mr. Barlogi can be excused?
MR. THOMPSON: Yes.

HEARING OFFICER: So you're excused, Mr. Barlogi, to go back to managing and delivering water, an important thing to the patrons of Twin Falls Canal Company.

I think we have one matter pending. Mr. Budge, you asked if the Department would redact a portion of Mr. Barlogi's written testimony.

MR. BUDGE: Yeah. And then I didn't object when he quoted it, so we're going to let it slide.

HEARING OFFICER: So you want to let it go?

MR. BUDGE: I think the objection is still appropriate, that it's based on hearsay, but --

MR. FLETCHER: It's in the record.

MR. BUDGE: It's not that critical at this point.

HEARING OFFICER: All right. That simplifies the operation of a black pen.

Okay. We'll come back at 1:00. Thanks, everybody.

(Lunch break taken.)

HEARING OFFICER: We are back on the record after a lunch break.

Mr. Sullivan, you're next. Will you stand and raise your right hand, please.

///

GREGORY K. SULLIVAN, P.E.,
called as a witness by the City of Pocatello, having been first duly sworn to tell the truth relating to said cause, testified as follows:

MS. TSCHOHL: Can you guys make sure the microphones are on?
(Discussion held off the record.)
HEARING OFFICER: Now, is that better, I hope?
MS. TSCHOHL: Yes, we can hear you loud and clear.
HEARING OFFICER: Okay. Good. Thank you, Sarah.
All right. Mr. Sullivan has been sworn in.
Ms. Klahn?
MS. KLAHN: Thank you.

DIRECT EXAMINATION

QUESTIONS BY MS. KLAHN:

Q. Good afternoon, Mr. Sullivan.
A. Good afternoon.
Q. I'm Sarah Klahn. I represent the City of Pocatello, and we're here to put on your expert report in this matter.
Could you start by stating your name and

spelling it for the record, please.

A. Gregory K. Sullivan, G-r-e-g-o-r-y, S-u-l-l-i-v-a-n.

Q. And are you a consultant engaged by the Cities to present opinions in this matter?

A. Yes.

Q. What's your present professional position?

A. I'm the president of Spronk Water Engineers.

Q. And do you have any professional registrations?

A. Yeah, I'm a licensed professional engineer in Colorado, New Mexico, and Idaho.

Q. And I believe the parties have stipulated to your admission as an expert in this matter, so I don't want to go over all the things we normally would go over in that context.

But can you describe, in just a couple sentences, your general work experience?

A. For my entire career I've been working in water rights and water resources engineering; for my present company since 1990, and then for a different company for the five years prior to that.

So I've been working in this area of water resources, water rights, modeling groundwater for my whole career.

Q. And have you participated in the -- in prior delivery calls?

A. Yes, I have.

Q. Which ones?

A. I was -- I've been involved in the Surface Water Coalition delivery call since its beginning. And then I was also heavily involved in the A&B delivery call and the Rangen delivery call.

Q. And you have experience with the SRBA as well?

A. Yes. I've assisted numerous clients in filing for their claims and reviewing the claims, helping them get them adjudicated.

Q. Can tell us about your modeling experience in Idaho.

A. I've been a member of the Eastern Snake Hydrologic Modeling Committee since its inception and, actually, prior to that, the Idaho -- ITCH, the Idaho Technical Committee on Hydrology, that was the predecessor group.

And both of those -- one of the major tasks of both of those groups has been to sort of oversee and provide peer review on the development of the Eastern Snake Plain Aquifer model over the years.

Q. Thank you.

Who exactly are you representing in this

matter?

A. The City of Pocatello, the City of Idaho Falls, and the Coalition of Cities, which is 15 smaller ESPA cities.

Q. And you mentioned that you've been working on the Surface Water delivery call for a number of years.

Were you involved in the original 2005 Surface Water delivery call?

A. Yes.

Q. Can you describe, in a general way, the investigations you conducted at that time?

A. Well, we compiled data, reviewed the voluminous data that was submitted by the parties, and then, importantly, we conducted a pretty thorough investigation of all of the Surface Water Coalition members. And that included reviewing, you know, a lot of their historical information, historical records.

We spent, like, three weeks in the field, you know, going through all of their systems, observing them and observing their water conveyance and delivery facilities involved, looking at their irrigation practices. It was quite extensive.

And that culminated in an analysis that was summarized in my original expert report of their operations during the period from -- I think it was 1990

to 2006.

Q. Okay. And have you produced an expert report in this matter?

A. Yes, I have.

Q. Okay. And that would -- is that Exhibit 347? Could you find that?

Now, Mr. Sullivan, I understand that you were out of the country immediately before the start of this hearing; is that right?

A. Yeah. I was in Spain and Morocco.

Q. And I believe that when you returned, you had a chance to review the report, which you had largely completed before you left; is that right?

A. Yes. I had a little bit of opportunity to work on it while I was away, but spotty internet connections and stuff like that. And so, yeah, I looked -- I was able to look at it in some more detail when I got back.

Q. And when you got back, did you discover that there were some errors -- editorial errors, primarily, in the report.

A. Yes, there's some things I would like to correct.

Q. Okay. And are you looking at Exhibit 347 that has the pages of errata? I just want to make sure we

have the current version in the exhibit binder.

MR. FLETCHER: Is this 347?

MS. KLAHN: 347A. Sorry.

THE WITNESS: I don't think it is.

MS. KLAHN: 347A, is there such a thing up there?

No, I know, but did we make a copy of it?

THE WITNESS: My copy has that.

MS. KLAHN: I know yours does.

MR. BROMLEY: I can get it printed.

MS. KLAHN: Let's just go off the record for a minute.

(Discussion held off the record.)

MS. KLAHN: Back on the record.

Q. (BY MS. KLAHN) So the conversation we just had off the record was about replacing 347 with 347A at the conclusion of your testimony.

However, Mr. Sullivan, did you have something to explain about the -- some of the errors maybe not being completely editorial?

A. There was a handful that were -- you know, I just missed a word. And, like, for example, the word "not" was in there and something -- in one of the statements; and that "not" should not have been there.

So that's substantive.

Q. Well, do you want to take a minute now and identify where that is so people can get in, if they have a paper copy of the old version, and change that?

A. I don't think I can do it thoroughly with what I have right here. I have, like, a redline on my computer.

Q. Well, we'll just keep going, then.

A. I'll try to remember if I see something.

MR. FLETCHER: Just to clarify this issue, the page numbers changed when you changed exhibit numbers. So it's going to be very -- is there anybody that has an extra copy or a copy of 347A that the witness can --

MR. WOOD: I can print one off if somebody emails it to me.

MR. BROMLEY: Yeah. So Max has it right here. Can he send it to you, Pete?

MR. WOOD: Okay. Email it to me, and I'll go print it.

MR. FLETCHER: Because otherwise this is going to be confusing.

MR. WOOD: Yeah, it's fine.

MR. BRICKER: What's your email?

MR. WOOD: pete.wood@idwr.

MS. KLAHN: Shall we take a five-minute recess maybe?

HEARING OFFICER: That would be fine.

(Break taken.)

(Exhibit 347A marked.)

HEARING OFFICER: All right. Back on the record.

Ms. Klahn.

MS. KLAHN: Thank you, Pete, for your help with that.

MR. WOOD: No problem.

Q. (BY MS. KLAHN) We're back on the record.

And, Mr. Sullivan, you've been presented with Exhibit 347A. And in that report, could you identify -- we were just talking before we broke to get a copy of this, we were talking about your involvement in the other delivery call matters.

Does this 347A -- Exhibit 347A show the -- have a list of the reports you've prepared in prior delivery call matters?

A. It does.

Q. Could you identify where that is?

A. It's on page 4. This isn't all the other delivery call matters, it's just the reports, like, related to this delivery call -- or the Surface Water Coalition.

Q. Yes, that's what I meant, in the Surface Water

Coalition delivery call. Okay. Thank you.

Do you still stand by the opinions in the prior reports?

A. I do.

Q. Do you still stand by the methods you used in the prior reports?

A. Yes.

Q. Have you updated any of those analyses?

A. I would have liked to, but there wasn't time.

Q. And then as far as your work in this case, you said you haven't updated your work from the last case, but have you identified changed conditions since you prepared the prior reports?

A. Yes.

Q. And what page is that on in your report?

A. It's the series of bullets near the bottom of page 2.

Q. And then one more sort of foundational question.

Were you involved in the 2022 technical work group process?

A. I was.

Q. How were you involved?

A. I received an invitation to that. And there was a series of meetings -- half a dozen meetings, I

think, that the Department hosted that I attended remotely. And then I presented some information at a couple of the meetings on a couple of the subjects. And then, ultimately, when the staff recommendation was issued, I reviewed that and submitted written comments to that.

Q. Okay. And just for the record, I'd ask you to take a look at Exhibit 316.

Is this the staff recommendation that you referred to?

A. Yes.

Q. And Exhibit 326, could you take a look at that? Is that the comments that you submitted in response to the staff recommendation?

A. 326, it looks like Sophia's comments.

Q. How about 327?

MR. BRICKER: I think it's 322.

MS. KLAHN: 322. Sorry.

THE WITNESS: Yes.

Q. (BY MS. KLAHN) So 322 are the comments that you and your colleagues at Spronk Water Engineers submitted in response to the technical work group?

A. Yeah, in response to the staff recommendation memo.

Q. I apologize. Yes, that's right. In response

to the staff memo.

Did you receive any feedback on your written comments from anybody at IDWR?

A. I did not.

Q. Now, let's take a look at Exhibit 300, which is the Fifth Methodology Order, and Exhibit 301, which is the As-Applied Order.

A. Okay.

Q. Have you previously reviewed Exhibit 300?

A. Yes.

Q. Were your comments submitted to the technical work group incorporated into the Fifth Methodology Order?

A. Not that I could tell.

Q. And as far as the hearing today on the two orders reflected in Exhibit 300 and 301, in your professional estimation, did you have adequate time to review the Fifth Methodology Order and the As-Applied Order to prepare for the hearing?

A. No. I mean, I did what I could, but there wasn't time to do all I would have liked to have done.

Q. So let's just -- for a high-level summary, let's talk about what work you were able to do.

And I believe if you turn to the table of contents in Exhibit 347A, that might be a guide for

your -- if you can give us an overview of what work you were able to do.

A. Yeah. So in addition to just reviewing the order and the Fifth Methodology and the As-Applied Order, then there was a number of issues that I identified that I ended up focusing on. And they're, basically, the subject of my expert report.

So that was looking at the new baseline year; looking at the updated project efficiencies for the Surface Water Coalition members; looking at the irrigated area that is used in the methodology; considering the supplemental groundwater as a potential source to the Surface Water Coalition members, which is a provision of the methodology; looked at the change from steady state to transient groundwater modeling for determination of the priority date of curtailment. So those are the main things I focused on.

Q. Okay. Could you identify the work you would have done if you'd had more time?

A. Well, I would have liked to have, you know, looked at the -- taken another -- a relook at the operations of the Surface Water Coalition members because there's been 15 years, roughly, since -- have elapsed since I last looked at them, and I know, anecdotally, there's been continued conversions to

sprinkler and canal lining and other automation, those things that we heard Jay Barlogi talk about today.

So I'd like to understand the extent of those things that have gone on. And then, you know, that would give me a good -- a better context, I guess, to then look at the records of what they've been using over that time and consider the sort of the reasonableness of their operations given what their efficiencies are. So that's one thing I would have liked to have done.

Q. Okay. The -- it has been 15 years since the 2008 hearing, exactly 15 years almost.

How does the changes during that time -- how would the changes during that time inform your, I guess, opinions if you'd had the time to look at those changes, potentially?

A. Well, you know, for example, these updated project efficiencies, you know, I think by analyzing the Surface Water Coalition numbers, it would give me -- operations over the last 15 years, that would give me a better ability to judge the reasonableness of those efficiencies and whether they're -- the revised efficiencies are consistent with the kind of facilities that they have and if the general, you know, industry standard of large -- of the operation of large irrigation systems.

MS. KLAHN: Now, I'd like to offer Exhibit 347A at this point just so I don't forget to do it.

HEARING OFFICER: Any objection?

MR. FLETCHER: I have an objection just to a couple of comments made by Mr. Sullivan where he's delving into the realm of judicial review. And, basically, I'm asking that certain portions of the report be stricken. They're very small, but one is on the bottom of page 6 and continues to page 7 where he talks about the findings of the Director to be arbitrary and no clear and convincing evidence.

On page 7, paragraph 2, he talks about the actions of the Director being arbitrary and capricious.

And in page 27, bullet point 3, he makes reference to Director's actions being arbitrary.

And those are standards for judicial review. They're really not an expert's standard dealing with data and data interpretation.

HEARING OFFICER: Ms. Klahn?

MS. KLAHN: Well, I would say what's sauce for the goose is sauce for the gander, and Mr. Brockway has similar statements in his report. I think that expert s, especially in the water realm, routinely make those kinds of statements. And I'm assuming the Director has

seen that before and will take it for what it's worth and that it's certainly not going to control any appeal that might be filed and heard by Judge Wildman. So I would say they're not the sort of thing that should be stricken, but if they are, then the same thing should come out of Dr. Brockway's report.

HEARING OFFICER: Well, and of course, I don't know what Dr. Brockway's report even says.

MS. KLAHN: Oh, I think all I'm asking for is a global rule, not just a groundwater-specific rule.

HEARING OFFICER: I'll overrule the objection. I don't think these references will affect my decision-making in any way. Overruled.

MS. KLAHN: So is the exhibit accepted, then?

MR. FLETCHER: I don't have an objection.

HEARING OFFICER: So the document marked as Exhibit 347A is received into evidence. Thank you, Ms. Klahn.

(Exhibit 347A received.)

MS. KLAHN: Thank you.

Q. (BY MS. KLAHN) Mr. Sullivan, let's start with baseline year investigations that you had time to do.

Could you describe your review of the baseline year that was selected for the Fifth Methodology Order?

A. While there was some discussion of that at the

technical working group, it was one of the things that was brought to us. And the basic proposal was -- or the information that they submitted to us and is described in their -- I think in the Fifth Methodology Order was that the previous baseline year, which was an average of diversions during 2006, 2008, and 2012, was no longer representative of a year of above-average diversions, and that's because there had been -- they recomputed the average with an additional six or eight years, so the average changed, and now that baseline year, which -- '06, '08, '12 -- which was above average before now is just a tiny, tiny bit below average.

And so I endeavored, then, to just review that pretty simple data of the diversion data in relation to the new baseline year that was selected and just kind of verify or understand the math that went involved -- that was involved.

Q. Do you have a recollection of how much below average the post -- I'm going to call it '06/'08/'12 baseline year was?

A. Yeah. Well, based on the information that was provided by the Department, the '06 -- I'll call it '6/'8/'12.

Q. Okay.

A. The '6/'8/'12 baseline year was

5,666 acre-feet per year less now than the average. So that's, you know, 5,600 acre-feet out of 3.2 million. So just a very, very small amount, .18 percent less.

Q. So was there a problem with the backup spreadsheet for the '6/'8/'12 change that IDWR provided?

A. Well, I did note that when I looked at the information that was provided where they computed the new long-term average, which was now using data from 2000 to 2021, looking at the data within that spreadsheet, it looked like some of the numbers during the earlier part of the period had changed from what was used to compute the original '6/'8/'12 baseline, and I don't know why. Maybe that was provisional data that they updated, and it wasn't extensive, but there was some changes.

But, curiously, the Department was still using the original '6/'8/'12 value as the benchmark for comparison of the new average. That '6/'8/'12 benchmark was still from the old data, the uncorrected data, and I thought that was kind of -- I don't know if it was an oversight or intentional. But, anyways, when I plugged it -- I tried to recompute the '6/'8/'12 baseline with the new data, new diversion data, and it changed a little bit.

And now with the new '6/'8/'12 baseline -- or

with the updated diversion data, you know, is only now 40 acre-feet less than the 2000 to 2021 average. So just a tiny -- the tiniest bit less.

Q. So is 40 acre-feet pretty small in comparison to the total diversions?

A. Yeah, very small. I mean, it represents -- I put this calculation -- it represents about five minutes of diversion of the Surface Water Coalition members' total diversions on average. So it's a tiny, tiny amount. But to be sure, it's still below average.

Q. So the -- did IDWR include 2022 data when they were calculating the comparison for the '6/'8/'12 baseline year?

A. No, they didn't. And so that -- so that was something I thought might be interesting to look at, so I added on the data -- diversion data from 2022 and recomputed that long-term average, 2000 to 2022 now, instead of 2000 to 2021. And then when you compare that average to the updated '6/'8/'12 baseline year, then it turns out that '6/'8/'12 is still above average now.

Q. So based on your understanding of the Department's methodology for selecting a baseline year, if the average that's being compared to the old baseline year is greater, would it be appropriate to pick a new baseline year based on your understanding?

A. Well, I'm not sure if you -- maybe I misunderstood your question.

Q. Did I turn it around?

A. You might have turned it around. But I think if you include 2022 and then do that comparison, '6/'8/'12 will still qualify as a baseline year.

Q. That's what I was trying to get at. Thank you. Well, but a new baseline year was selected as 2018.

Do you recall what the total diversions were associated with 2018?

A. Yeah, it's 3,341,939 acre-feet.

Q. And what kind of increase is that over '6/'8/'12?

A. It's roughly 142,000 acre-feet more. So that tiny amount, you know, either 40 acre-feet or 5,000 acre-feet, that the old baseline year fell below the average, resulted in this huge increase in the baseline year, 142,000 acre-feet. And that was kind of eye-opening.

Q. Did you analyze whether the surface water -- well, let me ask you first: What was the diversion averaging period used in the Fourth Methodology Order?

A. I think it was 2000 to 20 --

Q. '14 sound right?

A. 2014, yes.
Q. Did you look at whether Surface Water Coalition member diversions increased since 2015?
A. I did, yes.
Q. And what was that amount?
A. Yeah, their diversions have increased on average by about 143,000 acre-feet.
Q. Which is --
A. So the diversions during the later period were 143,000 acre-feet greater than the 2000-to-2014 period.
Q. And the 143,000 is pretty close to the 142,000 increase in the baseline year from '06 -- '6/'8/'12 to 2018; correct?
A. Yes, uh-huh.
Q. Did you find any analysis in the materials provided by IDWR or Exhibit 300 that suggested that IDWR had analyzed why Surface Water Coalition member diversions increased?
A. I haven't seen anything like that.
Q. Okay. Were you surprised that the diversions increased from 2015 forward?
A. Yes, I was.
Q. Why?
A. Well, I mean, just my -- as I mentioned earlier, you know, the continued sprinkler conversions,

these efficiency improvements, those kinds of things would suggest that, if anything, the diversions should have gone down, anything -- that they should have been able to get by with less, but they've been diverting more.

Q. Do you have any concerns about the process that's used to develop the baseline year given these findings?

A. Yes. It seems like there's this positive feedback loop, I will call it, that exists in the process, whereby, essentially, the more they divert, the higher the baseline year needs to be to keep the baseline year as a year above average, and so there's really a disincentive to become more efficient because, you know, the more they divert, the higher the baseline year, the more the groundwater users have to come up with mitigation water.

Q. Thank you.

Let's move to project efficiencies. Were you here yesterday when Mr. Anders testified?

A. I was, uh-huh.

Q. Did you hear his testimony about the calculation used in the Methodology Order to calculate project efficiencies -- I'm sorry, to calculate -- about the use of project efficiencies to determine monthly

crop water demand?

A. Yes.

Q. Do you agree with how IDWR uses the project efficiencies in that calculation Methodology Order?

A. No.

Q. Why not?

MR. THOMPSON: I'd like to lodge an objection here. Just briefly, I think the methodology itself, these calculations Ms. Klahn is talking about, have been established, have been subject to judicial review. I don't think they've changed in the Fifth Order to the extent that we're opening up the methodology to redo it. So to the extent that she's asking for testimony about a separate methodology, I think it's beyond the scope.

HEARING OFFICER: Ms. Klahn.

MS. KLAHN: Mr. Director, our intention is to offer some suggestions about how to use the existing process that the Department has to make it more reliable. And the ground that was plowed in 2007 -- Mr. Sullivan will spend a little bit of time talking about why that was a good idea, but understanding, also, that that's not the direction the Department chose to go.

So when I ask if he agrees with how IDWR uses project efficiencies, it's to set up the testimony about

the improvements that he's proposing for the current approaches.

HEARING OFFICER: I think consistent in all of the discussions has been a theme that the Methodology Order was and is intended to be a dynamic document that would be subject to change and would change with better information, better data, and better analysis. And so as a result, I'll overrule the objection.

MS. KLAHN: Thank you.

HEARING OFFICER: Ms. Klahn -- or Mr. Sullivan, you may answer the question, if you remember it.

Q. (BY MS. KLAHN) I think the question was: Why don't you agree with how IDWR uses project efficiencies in the Methodology Order, generally?

A. Well, generally, it -- this is another one of these kind of feedback-loop things, that the historical diversions are used in determining the project efficiencies, and then the project efficiencies are used to determine the demand.

So it's kind of a self-fulfilling prophecy that the methodology that -- that the method will predict a demand that's equal to what they've been diverting. And so there's really no opportunity to interject and look at: Is what they're diverting

reasonable and consistent with industry standards, or do you never get to look at -- behind the curtain at the efficiency and the operation of the members?

So that's generally my concern.

And then, also, as I'll get into a little bit later, it presumes that crop water need is a good predictor of what they need to divert. And while, in theory, that is -- that would be true, and it's true of most systems, it doesn't seem to be true in this situation a lot of times, as we'll see, that they -- a lot of times these Surface Water Coalition members kind of divert what they divert no matter what the crop water need is.

So their diversions are kind of flat in relation to -- instead of going up with the crop water need.

So we'll get into that a little later.

Q. Okay. Well, I'm going to ask you to get into some of it a little bit right now.

First of all, when you talk about the IDWR calculation for project efficiency -- which, as Mr. Anders talked about yesterday, is crop water need times acres divided by diversions -- what kind of an efficiency is that, in your professional understanding?

A. Well, I've always called that an actual

efficiency.

Q. What's the result of an actual efficiency when you try and use it for administration?

A. Well, it does what I just talked about earlier. If you use the actual efficiencies, divide it into the crop water need, you're just going to get what they historically divert, more or less.

Q. And if you divert more, what happens to the efficiency number?

A. Then the efficiency goes lower, and then -- and then you get back to the same diversion.

Q. How did you analyze Surface Water Coalition member efficiencies in your first expert report in 2007?

A. Well, I applied what I would characterize as an industry standard approach for assessment of irrigation systems -- that I've done myself in a lot of situations and I've seen done in a lot of other situations -- in terms of both analysis of the historical use of irrigation systems for purposes of water rights transfers.

You know, I've done a bunch of those. And the procedure for doing that -- well, let me back up.

There's been hundreds or thousands of those kind of transfer analyses -- historical use analyses done for transfers in Colorado where I've done a lot of

my work, and that is the basis. Analyzing the systems in that way and the way that I did here for the Surface Water Coalition is what is done for those transfers.

And so those are very, you know, high -- you know, high-value or involving, you know, very important decisions about historical use. And a lot of money is at stake and all that.

And these are the methodologies that are used to do that -- you know, figure out how much water is being consumed and how efficient, you know, these systems are.

And then also in modeling, too, I've used these kinds of methods to evaluate the operations of irrigation systems.

Q. So in those calculations that you've done in those other situations, did you calculate a monthly or a seasonal efficiency?

A. So when I do those kinds of analyses -- and the standard is typically to calculate a seasonal efficiency. And the reason for that is that if you're trying to vary the efficiencies monthly, then it brings into question some other things that may be going on, particularly -- which is water moving in and out of soil moisture to help meet the crop demands. And if you don't accurately account for that, then you can get some

kind of misleading or monthly efficiencies.

And so, typically, to overcome that we will use a seasonal efficiency. Even when we're doing a monthly calculation, the input to that will still be a seasonal efficiency. And it helps to round out some of those curious-looking results that you get.

And we've seen in the methodology here where you've got, like, these very, very low efficiencies in some of the shoulder months that make the method real sensitive to -- you know, a small change in a crop water need divided by a low efficiency all of a sudden results in a large change in the diversion demand.

Q. Is the method you're describing one that's been used by IDWR in any prior delivery calls?

A. Yes. You know, the method that I used in my original analysis of the Surface Water Coalition ended up being, essentially, what the Department used in evaluating the delivery call of the -- for the B unit of the A&B system. And, in that, they were looking at, you know, whether -- the supplies of water that they were able to pump from the wells in the B unit and deliver to the farms, whether that was a supply that was adequate to meet the demands for those lands.

And so in that situation, the Department determined what the conveyance losses were in getting

water to the farms. And those are all real short conveyance systems because they're only delivering water down some laterals from a well. So in that situation I think the conveyance losses were on the order of 3 percent, say.

And then they looked at the on -- what the on-farm application efficiencies should be under a reasonable operation, and I think in total they ended up using a system efficiency -- or a project efficiency in A&B of about 75 percent. And that was, basically, the combination of the on-farm and the conveyance efficiency.

And that was used, then, to determine whether what they were able to deliver to the farm was enough to meet the crop water demand. And based on -- I think that was part of the reason that delivery call was denied was because there was a determination that they did have enough water.

Q. And the determination you're talking about, is that contained in an Idaho Department of Water Resources order dated January 29th, 2008?

A. That sounds right.

MS. KLAHN: Mr. Director, we'd ask you to take judicial notice of that Department document.

HEARING OFFICER: Any objection?

It is an order of the Department, so I'm willing to look at it. I'll take notice.

Q. (BY MS. KLAHN) Mr. Sullivan, let's go to figure -- let's go to your figures in Exhibit 347A. I'd like to start with Figure 3-1.

First of all, just let me just ask you: Does Figure 3-1 illustrate some of the testimony you've been giving about the concerns you have with the Department's use of the project efficiency crop water need determination?

HEARING OFFICER: What page are you on, Ms. Klahn?

MS. KLAHN: There's no page numbers at that point. If you go all the way through the report, it's right after the map. It's the first page of figures.

HEARING OFFICER: I found it. Thank you.

Q. (BY MS. KLAHN) Are you there?

A. Yes, I'm there.

Q. Do you remember my question?

A. You should read it again, if you wouldn't mind.

Q. Does Figure 3-1 illustrate some of the testimony you've been giving about your concerns with the Department's incorporation of project efficiency -- the Department's methods of incorporating project

efficiency into the Methodology Order?

A. Yes.

Q. Could you talk about what we're -- what Figure 3-1 shows?

A. Okay. So this is just showing a -- project efficiency information that was provided by the Department and that was used as the basis for the -- developing the monthly efficiencies -- project efficiencies that are used in the Methodology Order.

So on this page there's a -- several graphs. There's one graph for each of the Surface Water Coalition members. And the graphs depict project efficiency. That's the y-axis on each of these graphs. And it depicts monthly project efficiencies, at least for some of the data on here. So that's the months along the bottom.

And then the solid black line with the connecting -- the open white-and-black dots represents the monthly project efficiencies for each of the members that are used in the Methodology Order.

And then I also put on here, for reference purposes or comparison purposes, the dotted black line, which is the average of the monthly efficiencies used in the Methodology Order. And it's the same average number that I think is at the bottom of the table of monthly

efficiencies in the Fifth Methodology Order.

And then one more comparison I put in here is the blue line, and that's the -- what I term the "reasonable annual efficiency" or -- that I had previously determined for the Surface Water Coalition members based on my earlier work in my 2007 expert report.

Q. And what do you conclude from the figures we see -- the graphs we see on Figure 3-1?

A. Well, there's -- one thing is that, you know -- you can see the shape of these monthly efficiency curves are, you know -- with some exceptions, the efficiencies start out relatively low in the spring and then peak up in the middle of the irrigation season and then fall off quite a lot in some cases, in September and October.

The other thing I would note and just -- and compare in looking at -- comparing the dotted black line to the blue line is that in some cases the actual -- the actual efficiencies -- the actual project efficiencies represented by the average of the monthlies for some of the members it's pretty close to the number that I came up with previous ly.

So -- like for A&B, for example, they are operating at the level that -- near the level that I

thought they should be able to operate.

And -- but others -- you know, in cases where the dotted black line is quite a bit below what I had previously determined, then I think there's some room for improvement in some of those systems.

Q. Okay. Thank you.

Let's turn now to the next page, which is Figure 3-2. And would you talk about what we're seeing in Figure 3-2, please.

A. So this is just a depiction of some of the same information that was on Figure 3-1, and, specifically, the monthly project efficiencies for each of the members. And I just plotted them all on one graph here so that we could kind of see them next to -- or on top of each other.

Q. So would some of these differences in project efficiency be related to the nature of the -- nature and size of the canal system?

A. Yeah, it would. Because, you know, as I talked about earlier, this project efficiency is, basically, the -- has two components, there's a conveyance loss component, or a conveyance efficiency, and then there's an on-farm efficiency. And the product of those is the project efficiency.

And so for the conveyance efficiency piece of

that, you know, it's -- it makes sense, and it's true, that for long -- for very long and large conveyance systems that have more miles of canal, they're going to have more seepage loss in delivering water. So you'd expect them -- those kind of systems -- like an AFRD2, for example, they're going to have a lot larger conveyance efficiency -- oh, wait, conveyance loss than would be a smaller system like A&B, for example.

So you would expect that these monthly efficiencies wouldn't be the same, necessarily, but I don't think all of the differences between these are due to conveyance efficiency. I think that some of -- and we'll get into this, I think, a little bit later -- but some of this difference is due to some of these systems in pulling up, basically, a higher level of management and so that they're able to just generally be operating more efficiently both, you know, in delivering water to the farms with less waste and then also the farmers taking -- you know, having to operate more carefully, you know, to meet their crop water needs.

For example, because some of these -- some of the Surface Water Coalition member systems set an annual allotment so the user has to operate within that allotment, and so there's kind of a built-in incentive to only take the water and use it when you need it.

But other systems that are more on demand, like Twin Falls, for example, they don't have an annual allotment, so, you know, they can take up to a rate of flow whenever they want to order it. So in those systems, there's not as much incentive to conserve water, and I think that kind of thing plays into the reason why some of these efficiencies are different.

Q. Thank you.

Let's look at Figure 3-3, please.

This is titled, "Reasonable and Actual Project Efficiencies 2008 Hearing vs. Fifth Methodology Order."

What is this showing us?

A. This is some more of that information that I had on the previous page with some additional information as well.

So in this graph now, and then this graph at the top, and then the numbers in the table below, it's -- you know, they're both the same information. I'm graphing the numbers. And what the graph shows is the annual project efficiencies or seasonal project efficiencies for each of the members and different depictions of that.

And then along the bottom, I just have -- there are the members called out themselves.

And so the Fifth Methodology efficiency -- or

average -- the average efficiencies in the Fifth Methodology Order are the black dots joined by the black line.

And then the efficiencies that the average project -- actual project efficiency, so the comparable number that I determined for the Surface Water Coalition members for the 1990-to-2006 period that I analyzed earlier for the -- my 2007 expert report is shown with the red line.

And then I've also -- related to the red line is this pink area, and that pink area represents the range of annual efficiencies that I determined for each of the Surface Water Coalition members for that 1990-to-2006. So they vary from year to year, so I've got the range reflects the minimum and the maximum, and I've shaded the area in between.

And then, finally, I have shown on here what I've termed the reasonable efficiency, and that's that -- the reasonable project efficiency that I had previously determined from that -- from my work in the original Surface Water Coalition delivery call.

Q. What conclusions do you draw from Figure 3-3?

A. Well, one, is when I compare that -- the red line to the black line, that shows that for -- you know, most of the Surface Water Coalition members, that black

line is less than the red line, and so that indicates their actual efficiencies have gone down since 1990 to 2006. So I thought that was interesting.

That's going the opposite direction from what I would expect given these continued conversions to sprinkler, canal lining, better irrigation system operation technology, and that sort of thing.

The other thing that I would note from this is that my blue line, the reasonable efficiency line, is -- you can see that the -- that red-shaded area, which is the range of efficiencies, kind of butts up to that blue line for most of the users. And so that -- that indicates that during 1990 to 2006, most of the -- or at least, roughly -- well, five of the seven members were shown an ability to operate at a reasonable level that I had determined previously and determined independently.

And so this is kind of a validation, I think, of the method that I used previously. But then, you know, the exceptions here are over here for North Side and Twin Falls, whose operations -- you know, historical operations during 1990 to 2006 fell well below what I thought they should be operating at.

Q. Have there been -- I think you've already answered this question, but just to close the loop here: Had there been time, would you have updated the

reasonable project efficiencies for the Surface Water Coalitions based on your -- based on their operations during the last 15 years?

A. Yes, I would have liked to have updated that blue line.

Q. And if you had updated it, what would you have done with that?

A. Well, I would have -- I would expect that, you know, with -- just for the simple issue of the continued conversions to sprinklers, they should have a higher on-farm efficiency. So just for that reason alone, I think the blue line should be going -- ticking up a little bit, and there may be other reasons that the -- you know, for other efficiency improvements that the blue line ought to tick up a little.

Q. Now, in 2007 you were recommending that the Department incorporate efficiencies -- the reasonable project efficiencies as a way to -- as part of the administration of the Surface Water Coalition delivery call; correct?

A. That's right.

Q. And I want to just talk about that for just a second because, as I recall, there's a lot of hostility to that idea, and I wonder about whether you could explain how would you operationalize something like

that?

Are you talking about an army of Department of Water Resources employees going out and checking on Jay Barlogi when he decides to open a headgate, or are you talking about something different?

How would -- whether your old efficiency approach is used or whether the Department's current one is used, how would you operationalize that in context of the delivery call?

A. Well, you know, by -- back then and now, I'm not suggesting that the Surface Water Coalition members must operate at these levels. What I'm proposing under this methodology that the project efficiencies be evaluated as to whether they're reasonable and adjusted, if necessary -- or I think it would be necessary to adjust them. But even if you did that, it just becomes part of the analysis to determine whether they're short or not and then whether that shortage requires mitigation.

So if they want to continue to operate at a lower efficiency level because it's easier to operate their systems and they want to continue their customary ways, I have no objection with that. But it does bother me when junior groundwater users are forced to curtail in order to maintain that continued less-than-efficient

operation.

Q. Well, in your report, did you prepare an alternate approach to propose to the Department to determine project efficiencies for the Fifth Methodology Order?

A. I did. And so I developed an alternate approach. My preference would still be to -- my number one preference would be to use the -- you know, use these reasonable efficiencies or approach the problem in that way and consider the reasonableness of efficiencies and apply some industry standard techniques to determine efficiencies that are potentially more reasonable.

But if the Department doesn't want to go there, then I've developed an alternative that would kind of work within the current framework but apply some additional sort of analysis and checks for how those monthly efficiencies are used.

Q. Is that described on -- or does that start -- that discussion start on page 14 of Exhibit 347A?

A. I think it's on 13.

Q. Page 13. Okay. I just wanted to note that for the record.

And then do you have some illustrations of the discussion that you have starting at page 13, maybe starting at Figure 3-4 in the back?

A. Yes. I prepared a series of graphs, so there's -- it's all the way from 3-4 to 3-18, 3-19. But within those, there's basically two sets of graphs. So in this first set of graphs that we're going to talk about, I've plotted the annual diversions of the Surface Water Coalition members during 2007 to 2021 against the annual crop water need.

Q. So this is -- we're looking at Figure 3-4 right now; is that correct?

A. Yes.

Q. So what do you conclude from the plots that you created in Figure 3-4?

A. Well, so what I'm showing in Figure 3-4 is these are annual -- so it's the annual diversions plotted against the annual crop water need in a -- what I call a scatter plot, XY plot. And those are the dots that are shown for each of the Surface Water Coalition members.

And then I've also drawn a trendline, best fit line, through the points, and that's the colored, dotted line that's the same color as the dots.

And then for just comparison purposes, I also plotted this black line. What the black line is is taking the annual crop water need divided by the average annual efficiency in the Methodology Order.

So this depicts on an annual basis what you would compute as an annual diversion demand from the annual crop water need and the annual efficiency. And you can see, even -- we'll look at this on a monthly basis, too, in a minute -- but even on an annual basis, you can see that the black line for -- is, in all cases, steeper than the trendline, and in some cases much more -- some cases much more steep.

And so what that indicates is that this calculation involving crop water need and efficiency is, basically, predicting a diversion demand, and it's predicting a relationship between the diversion demand and the crop water need that is different than what is actually present in the data.

So the data shows -- you know, you can see this in an extreme way, you know, under AFRD2, for example, that their diversion -- and that's with the purple dots in the upper right -- that those purple dots and the line drawn through them are relatively flat. And so, you know, even when the crop water need is changing, they're just diverting, more or less, the same -- a similar amount every year; whereas, the black line would -- you know, and the Methodology Order suggests that it ought to be going up and down, and that's sort of an implied part of the Methodology Order.

Q. Okay. Do we need to look at each of the individual companies, Figures 3-5 through 3-11, or can you kind of maybe highlight a couple of them that are --

A. Yeah, we might do that, you know, flip through some of them.

One thing I would also say about Figure 3-4 and point out is the amount of scatter in those dots. And so, you know, that as the crop water -- for the same crop water need there might be a diversion, you know, even for just using -- like, I don't know, what's a good one? -- Milner, for example, you know, with a crop water need of 30,000 acre-feet, we see that they diverted 50,000 acre-feet in one year and then as much as 65,000 acre-feet in another year. So you just have a lot of scatter in this data.

So then moving on --

Q. Why don't you pick out a company or a canal and let's --

A. Well, I think like A&B, for example, that's the next one, there's a -- you know, you can see that -- and this is the same information on these next set of charts as I was just talking about, only in this case, it's annual -- I mean, it's monthly data for each of the users.

Q. And so you're starting with Figure 3-5?

A. Figure 3-5. So this is A&B. So here I'm plotting the monthly crop water need versus the monthly diversions, and I've got a graph for each month. So the graph in the upper-left is April, and then to the right is May, and then going down to the left is June, July, August, September, and October, finally, at the bottom. And each of those, again, I'm plotting, with the dots, the crop water need -- monthly crop water need versus monthly diversion and plotting a trendline through it.

And for A&B, you know, which is a user that I think operates pretty efficiently, you can see that there is a pretty good correlation between what they divert and the crop water need. And those trendlines are, you know, not too far off the theoretical line, which is the black line, you know, the crop water need divided by the project efficiency.

Q. Basically, the black line shows what is being administered --

A. Yes.

Q. -- correct?

Okay.

A. But for other of the users it's not -- it's different. And it can vary by month. And some months it line s up pretty good, and other months it could be way off.

So, like, for example, on the next one, the next graph, 3-6, when you look at May for AFRD2, you've got those orange dots, and the trendline through them has a much flatter slope than the black line would suggest.

And then just flipping through the rest of these BID, Milner, you see a similar looking situation where you've got -- sometimes the trendline lines up with the black line, but at other times it doesn't. And in a lot of cases you still have a lot of scatter, too.

Q. So does this -- what does this tell us about the crop water need divided by project efficiency term as a predictor of diversion demand? Or does it tell us anything?

A. Well, it doesn't -- it tells me that it's not a great predictor. It's not the -- you know, the crop water need divided by efficiency is not the only thing that's going into what they're diverting.

Q. So can we move now to Figure 3-12?

A. Well, I would just note, then, with the last couple of them, North Side and Twin Falls, you can see --

Q. And those are Figures 3-10 and 3-11? I apologize --

A. Yes, 3-10 and 3-11 where -- you know, and for

these users, you know, you see that -- quite a lot of mismatch in many or most of the months where what they divert is -- seems to be a lot less -- what they divert is a lot less sensitive to the crop water need than the relationship in the Methodology Order would suggest it ought to be, a black line.

Q. Now, I do have a question for you.

At the top of each of these graphs from 3-5 to 3-11 there's some blue text that says: "Exclude Project Efficiency Outlier Months (>+/-2 Standard Deviations)."

What does that refer to?

A. Well, that's a filter that the Department had put on when they were -- when it was evaluating these monthly efficiencies, that it was excluding the outliers. So I follow that same procedure to also exclude those.

But that's a good point, in that there's values that are straying even further -- historical values that are straying even further from the data that I have plotted on here that aren't plotted.

Q. Okay. So can we move on to this next group of graphs starting at Figure 3-12?

A. Yes.

Q. So this is titled -- these are a series, I think, by company -- or member, rather, titled, "Annual

Project Efficiency v. Annual Crop Water Need."

What are we seeing in Figure 3-12 through 3-19?

A. So this is a comparable set of graphs. So this first graph, 3-12, is one where I'm plotting the annual project efficiency versus the annual crop water need for -- and this is back on a graph where I've -- this graph where I've got a separate graph on this figure for each of the Surface Water Coalition members, the seven members.

So I'm plotting their annual project efficiency computed from the data against the annual crop water need.

Q. Okay.

A. And then similar to the last discussion or the last set of figures I was discussing, then I have some additional figures where I show the monthly values for each of the Surface Water Coalition members on separate pages.

Q. So can we pick out some of the monthly graphs that have strong correlations between project efficiency and crop water need?

A. Yes, I can do that.

And then also I would note that for each of these trendlines drawn through the data, I've got the

equation for the trendline and also the R-squared value for how good of a fit that trendline is through the data.

And so when I -- I considered a good relationship is when the R-squared was at least -- was above .5.

Q. Okay.

A. And so you can go through these and --

Q. Why don't you pick one or two, based on your professional understanding, then, of which ones would be significant. And then --

A. Well, there's, you know -- like, on A&B you can see that, you know, there's -- like, April and June there doesn't seem to be much relationship.

Q. Tell us which figures you're looking at. Sorry.

A. Oh, sorry. Figure 3-13.

Q. Okay.

A. Like, when you have a lot of spread in here, and there's not a good relationship, that suggests to me that they're operating probably at a higher level of efficiencies. And actually some of them vary -- the scatter that you're seeing in this plot, it reflects water that's going either into or coming out of soil moisture to meet the crop water need. And that's not

part of the calculated efficiency, and that would be a reason you'd get more scatter. If you could build that into the analysis, I think some of this would tighten up.

Q. So, actually, a poor R-squared in these graphs, 3-12 through 3-19, is an indicator of, potentially, good operational efficiency?

A. Probably operating at higher -- closer to the higher end.

Q. Okay.

A. Or at a more reasonable level.

Q. So if we go through these and find the graphs that have low R-squared, that would be an indication, in your professional opinion, that the operations are what?

A. Tend to be more efficient than not.

Q. So then if we go, for example, to 3-14, and we see AFRD No. 2 in July, R-squared .86, what does that tell you?

A. Well, so that tells me that their project efficiency is changing with the crop water need, which that, just by itself, doesn't make a whole lot of sense to me, that -- if you're operating at a reasonably high level of efficiency, your efficiency should be roughly the same or near the same regardless of what the crop -- the variation in the crop water need has been in that

month.

And if the crop -- if the efficiency is going up as the crop water need or the crop consumptive use increases, that suggests to me that they're diverting an excess of what they need. And the reason the efficiency is going up is because the enumerator is just getting larger and larger with the higher crop water use.

Q. Okay. Well, before we tie a bow on this, what else -- is there anything else that you would like to mention about these tables, 3-12 through 3-19 -- I'm sorry, Figures 3-12 through 3-19?

A. Well, just -- I mean, just because -- you know, I did note, like, for some of the users like North Side and Twin Falls, who we've been talking a lot about, you know, turning to the Twin Falls page, Figure 3-19, you can see that there's a pretty strong relationship now for them -- for Twin Falls and an R-squared much greater than .5 in all of the months but April. That -- that suggests to me that Twin Falls is probably, you know, operating at -- diverting more water than they need, and the only reason their efficiency is changing is because that numerator is changing.

Q. And remind us what the numerator is again?

A. When you're computing the efficiency, it's the -- the crop irrigation requirement, the CIR, times

the acres, and that's the crop water need.

And so as -- you know, in a hotter, drier year, that -- the crop water need will be greater, so that numerator becomes greater.

But you can imagine -- just for a simple example, then, if they divert the same amount of water every year, just in a hypothetical, and the crop water need is different every year, and you're always diverting enough water that the numerator stays the same and -- no, wait -- the denominator stays the same and the numerator, the crop water need, is changing from year to year, then you'll get that perfect relationship; that the computed efficiency will go up in lockstep with the crop water need.

And that's a reflection of the actual efficiency, but it's also a reflection that they're not operating at a reasonably high efficiency level, at least in those years where the efficiency -- the computed efficiency is lower.

Q. Okay. Well, what would you propose that -- what would you propose for the Department to do with all of this information?

A. Well, I guess, for one, I wish they would just consider it, you know, and apply some sort of -- take this information and think about what it reflects and

whether the efficiencies that are used in the methodology are reasonable or can be modified to consider this information.

And I have -- I've proposed a couple of alternatives as a couple of many potential things that you could do.

So what I propose, then, is based on this information that I was just talking about. It appears that at least for -- you know, for many of the members and in some or many of the months, there is a good relationship between the monthly project efficiency and the crop water need and -- even though I think it would be better to use that relationship just as a small fix than to just use a fixed average value in the Methodology Order.

And so what I propose, then, as one small fix would be that for the situations where we have an R-squared that's more than .5, that you would use that regression equation to compute the project efficiency.

Q. And what regression equation is that?

A. It's the regression equation that's shown on each of these -- in figures --

Q. So give us an example.

A. Yeah.

Q. Let's look at Figure 3-19, for example.

A. Okay. So let's go -- let's say for June -- this is Twin Falls. So for June we have a -- that's the second graph down on the left. It's with the green dots.

So that -- the trendline, that's the regression line I'm talking about. It has -- the equation for that line is over on the left with the R-squared of .781. So I would propose that you would use that line -- or that regression equation to compute the Twin Falls efficiency in June and for all of the other months that the R-squared is greater than .5.

But I would also propose that in addition to that, that you would establish a floor, and you would allow -- the efficiency that you would compute would be no lower than the average. And so that would prevent, then, you from using, in the methodology, these very, very low efficiencies on the lower end.

Q. So give us an example of one that you think is too low?

A. Well, let's go to, like, September, for example. September has efficiencies that are ranging from -- you know, that's the -- with the purple dots ranging from, you know, roughly, 12 percent up to 40 percent.

So I would propose that you would use that

regression line, but you would have the floor for what you would compute, from that regression line, be the average, or at about 25 percent.

Q. Oh, the average of the purple dots in September --

A. Yeah.

Q. -- would be the floor?

A. Would be the floor.

And then you would go up on that line from there.

Q. Okay. And so if you use -- and the regression business is beyond me, I'll admit.

So if you're using the regression to compute the efficiency, what are you not using?

A. Well, you're not using just a fixed monthly value, average value, all the time.

Q. Which is what IDWR does now?

A. Yes. And so this would result in -- in months with a higher crop water need, you would use a higher efficiency. And that is -- you know, that's actually reflected in the historical data. So in that case, I'm not applying any of my reasonableness test or anything, I'm just working within the historical data.

Because what happens in the methodology now is that if you get -- if you use the average efficiency and

it's a year with a -- or a month with a relatively high crop water need, you compute that average efficiency into the crop water need, and you end up with a diversion that's actually greater -- a diversion demand that's greater than what they actually diverted in that year.

Q. Oh, I see.

A. So it inflates it to more than what they historically diverted.

Q. Okay. I see.

Now, did you prepare any kind of -- I'm going to call it a hindcast to evaluate this proposal?

A. Yeah. Well, there's one more piece that we didn't talk about, and that's what to do when the R-squared is less than .5.

Q. Oh, right. I'm sorry.

A. So when the R-squared is less than .5, then I'm proposing that -- well, let's not use a regression equation, but we can just use a fixed value -- but I would propose that we would -- rather than using the average value, we should use like a -- and I'm proposing the 75th percentile value. So it's a value on the, you know -- well, at the 75th percentile, so it's not the highest they've shown they can operate at, stepping back down, right in between the average and the highest

values.

Q. So could we look at Figure 3-16 for a minute, that's Milner. Milner has a mixture of months that are -- for which the R-squared is below .5 and above .5.

So using Milner as an example, would it be -- would that mean that, for example, April where the R-squared is .13, what would you do in that month for purposes of an efficiency for the Methodology Order?

A. Well, in all of these when the R-squared is less than .5, you would just pick a value that's at the 75th percentile level; so in other words, excludes the upper one-quarter of the highest efficiencies.

Q. So pick one of the blue dots that's between the 50 percent and the 100 percent?

A. Yeah. I mean, April is not -- April is sort of -- let's not talk about April. April is kind of a weird month, and particularly for some of these users, where the reason we get these efficiencies that are greater than 100 percent is in -- some of the -- in the early months is that you can have a situation where they're only diverting for part of the month. So you've got a partial month diversion compared to a full month crop demand, so when you do that division, you can end up more than 100 percent.

Q. Oh, I see.

A. And that's because, you know, some of the crop demand is being met by soil moisture that's stored over the winter or from the previous season. So that's why --

Q. Well, can we talk about June, then?

A. Yeah, June. So, you know, just eyeballing what the 75th percentile here might be through those points would be, you know, maybe 60 percent, 65 percent or something like that. So higher than the average but not as high as, you know, the 75 or 80 percent that they've shown they have operated at in the past.

Q. So the 75th percentile not the 75th percent?

A. Yeah, the 75th percentile.

Q. Okay. Can we move to Tables 3-1 and 3-2 to talk about the hindcast?

A. Yes.

Q. Okay.

A. So --

Q. Let's start with 3-1.

A. So I did a -- I did this hindcast analysis, but I just picked out -- I did it for two examples. I didn't have time to do it for all of the Surface Water Coalition members. So Table 3-1 is a summary of the results of the hindcast analysis that I did for the Twin Falls Canal Company.

Q. And let me just stop you and ask you to go through the columns, but when you get to Column 5, talk about how this matches up with past orders.

A. Okay. So what -- this table represents an annual summary of the analysis that I did. But the analysis is done on a monthly basis, so this is just adding up the monthly results into annual values.

Excuse me. So this was done for -- this analysis was done -- the hindcast analysis for 2007 to 2021.

So in the first column is the annual, the sum of the monthly crop water need values or the annual crop water need, so that's the acres that the Surface Water Coalition members have reported times the CIR, crop irrigation requirement, for that month based on the crops that were grown and the like. So that's the same value that that reflected. These are the values being used by the Department.

The next column, which I guess is also Column 1, "Adjusted Historical Diversions." So these are the historical diversions that the Department used in their analysis. It says "adjusted" because they've been adjusted for the rentals and things for water that was diverted but not actually used for irrigation.

And then there's the -- this is the -- I have

the November 1 forecast supply so that -- the other thing that you should understand, and this reflects the hindcast analysis that would be done in November. So it's -- you're looking -- the forecast supply -- I mean, the supply is based not -- this is -- sorry.

Q. It's actual for the year?

A. It's actual for the year. And I'm using the term -- the column headings that the Department uses, so it's not really a November 1 forecast. Earlier in the year, it's partially a forecast. In the beginning of the year, it's wholly a forecast. But at November 1, you're using what they actually -- their actual natural flow diversions plus what their storage allocation was for that year, and that's their supply.

Q. So just to make sure it's clear, this 3-1 is based on an analysis that the Department does?

A. In part --

Q. Yeah.

A. -- and these first three columns I'm talking about is the Department's data.

Q. Okay. Thank you.

A. So then the next set of columns is titled -- it's under the combined heading of "Annual RISD," or reasonable in-season demand, and so I computed that three different ways. So the first column, it's -- it's

the column with the "2" above it -- "CWN Divided By Methodology Order 5 Project Efficiencies." That's where I've computed the -- you know, on a monthly basis, I computed the diversion demand based on the crop water need divided by the Department's average monthly project efficiencies, and I did that for each month and then added them up in this table.

And importantly, though -- and I'll talk about this more in a little bit -- I'm using the current 15-year average monthly project efficiencies that are in the Methodology Order in every year.

Q. Okay.

A. And that's a little different than what the Department did in its hindcast analysis, so keep that in mind.

And then under Column 3, this is one of the two alternative formulations that I had -- that I had proposed. So in this Column 3-1 is where I computed the monthly diversion demands based on the crop water need divided by the efficiency, and the efficiency was computed using that reference -- I'm sorry -- that regression equation. And then when the R-squared was less than .5, I used the Department's average monthly project efficiency.

Q. So Column 3 implements part of the discussion

we just had about the R-squared values on the Tables 3-12 to 19?

A. Yeah.

Q. Okay. Thanks.

A. And then Column 4 is the same except rather than -- in the months where the R-squared is less than .5, then I used the 75th percentile.

Q. More than .5, you mean?

A. No, when the R-squared is less than .5, I used the 75th percentile project efficiency instead of the average project efficiency. That's just the little difference between those two.

Q. Okay.

A. So then when you get -- the results, then, are shown over in the next set of columns. It's the "November 1 Reasonable in-Season Demand Shortfall." And here I've just calculated the shortage, which is based on Columns 2, 3, or 4 minus the forecast supply, which is the November 1 forecast supply column.

Q. I see. Okay.

A. And so in Column 5, this is what I get from the Methodology Order, and this is -- if you compare these numbers to the numbers that were in the Department's hindcast analysis, you'll see that they're the same, actually, in 2021 -- that shortage, the

179,066 -- but the Department has some different numbers in the above rows, and that's because the Department was -- used -- rather than -- the Department in their hindcast analysis didn't use the current methodology average efficiencies in every year.

They computed a new rolling average in some of the years, and then in the earlier years, they were using a fixed number that was based on a -- some prior number, prior average. So suffice it to say, anyways, that that's the reason why so many shortages -- the shortages that I have here are a little different than what the Department had computed.

Q. Okay. And --

A. And then just for -- then, for comparison purposes, then I've got the shortage for those two alternatives that I picked out -- that I had identified. And you can see that, in these cases when there's a shortage, by implementing just those very, like, modest changes to how you compute the efficiencies and, you know -- and those modest changes are still working within the efficiencies that the Surface Water Coalition members have been operating at. But just making some small changes, you can see that you get some, you know, fairly big swings or changes in some cases in what the shortage is.

And that's -- you know, that's indicative of just an overall observation that I have, is that this method is very sensitive to what you use for the project efficiencies just as a general matter because we're operating on the margin here when computing these -- you know, comparing this forecast supply to what their diversion demand is. So, you know, at that margin small changes in the efficiencies can make or break whether you have a shortage or not.

Q. Let's go on and look at Table 3-2. This is titled, "Summary of Annual Reasonable in-Season Demands and Shortages for AFRD2."

What is this showing us, Table 3-2?

A. It's the same thing that I was -- for AFRD2 that I was just talking about for Twin Falls. I went through the same analysis only this is for AFRD2.

And, again, it shows that by implementing these modest changes that you can have some effect on the computed shortages.

Q. So do you have a summary opinion here about the modifications you've offered for the Department's use of the project efficiency values in the Methodology Order?

A. Well, you know, again, as I said earlier, my preference would be to apply a reasonableness test, as I

talked about, but maybe we're -- maybe we take baby steps. So at least it's just a small step in the right direction. I think the methodology would be improved by using -- employing the proposal that I have regarding the progression equation and 75th percentile efficiencies, to use those in the methodology rather than the averages that are currently being used.

Q. Let's switch gears and talk a little bit about irrigated area.

This probably is old news by now, but just remind us what are the irrigated acreage values used for in the Methodology Order?

A. Well, they're used in two different ways actually. They're used to compute the crop water need, like I was just talking about. So in each month in the methodology, you take the irrigated area times the CIR for that month, you know, based on the actual climate conditions, weather conditions in that month, to compute what the crop needs for each of the members. And that's -- that's part of determining the demand for the members.

And then the irrigated area is also used in the derivation of those project efficiencies because the historical project efficiencies are based on crop water need divided by -- historical crop water need divided by

historical diversions.

Q. So we've heard testimony from several witnesses about the irrigated acres numbers that are used by IDWR.

Is it your understanding that IDWR scrutinizes the acreage figures that are provided by the companies?

A. No. Based on what we heard, they really don't provide any scrutiny.

Q. And we've heard testimony that the acreage numbers are based on either a permanent place of use or shapefiles that were created some time ago; correct?

A. Yes.

Q. At the technical work group, did IDWR present their own analyses of irrigated areas?

A. They did. As kind of incidental to some of the information they were showing us, they had provided some analysis of irrigated area for each of the Surface Water Coalition members based on aerial imagery and remote sensing analysis of the members.

Q. Do you remember what years they were -- presented their own data for?

A. It was 2011, 2017, and 2021.

Q. Okay. And do you recall how the Fifth Methodology Order acres compare with what IDWR's irrigated land set determined for 2011, 2017, and 2021?

A. Well, for some of them, they were -- you know, the methodology acres were, you know, close to or even less than the remote sense data. And I think that's because some of the remote sensing includes some additional areas or double-counted areas and all.

But for three of the users in particular, the methodology acres were significantly greater than the acreages that the Department had presented in their analysis. And those users are Burley, Minidoka, and Twin Falls.

Q. So -- and let's take Twin Falls as an example because we've talked a lot about Twin Falls the last few days.

What would be the effect if the Methodology Order incorporated IDWR's irrigated lands set acreage instead of the shapefile Twin Falls provides?

A. Well, it depends. Because if you -- if you insert the revised acres, keep everything else the same, then you can easily see that you compute a lower crop water need. Take CIR times the lower acres divided by the same efficiency, you get a lower demand.

And I say "it depends" because if you actually -- if you took the lower acres and then multiplied it by the CIR divided by the historical diversions and go recompute your efficiencies, then

you'd end up in the same place. Because if you took your lower acres, computed the lower efficiencies, and then stuck those lower efficiencies back in order, you'd end up with a diversion demand that's exactly the same.

Q. So it's kind of a feedback loop?

A. Yeah. And so that's why I say it depends.

And, to me, I mean, to put in lower acres and then to suggest, well, we'll just lower the efficiencies and move on, that doesn't make any sense to me.

Q. That's what the Surface Water Coalition expert, Chuck Brockway, suggests, though; right?

A. Yes.

Q. As the fix for all of this?

A. Yes.

Q. Just reduce the acres, but also recalculate the project efficiency.

But then they end up with the same demand --

A. Yeah.

Q. -- correct?

A. Yeah.

Q. Do you -- despite that problem, which you've talked about, I think, at some length related to your recommendations on how the Department could use project efficiencies differently, what would be -- would it be preferable for the Department to use its irrigated lands

dataset?

A. Yes. I mean, I think that data is far more reliable than what they're getting from the -- from the Surface Water Coalition members based on those old shapefiles with no scrutiny applied to it.

And I'd be reasonably certain that the acres that are determined by the Department are acceptable for -- to use in the methodology.

Q. So if there was to be a -- I mean, in the context of a challenge to the reliance on the shapefile, as an expert, then, you'd be comfortable relying on the IDWR dataset rather than the shapefile file dataset as far as showing acres that are actually irrigated?

A. Yes. And we heard some discussion that, well, maybe there's some examples in IDWR analysis that there'd been some acres that were misclassified or -- well, I mean, you could fix those. Right?

I mean -- and if you were going to use the IDWR analysis, well, then provide it to everyone, and everyone can look at it and suggest where it be fixed, and we end up with a much, much better irrigated acres dataset to use in the analysis.

Q. So the Department runs the Methodology Order every year. Would they need to update the irrigated area dataset every year?

A. No, I don't think so.
Q. Why not?
A. Well, I mean, acres do change a little bit from -- can change from year to year. But, I mean, in my experience, and particularly for these and for large irrigation systems, there may be some long-term trends in acreage because of urbanization and things like that.
But for these particular members that all have excellent water supplies that they generally are irrigating, you know, largely as much as they can and -- but not -- in all systems there's some lands that get fallowed for various reasons, but in my experience, while it's different lands that are going in and out of the fallowing, the overall amount of fallowing is roughly consistent from year to year.
Q. And, in fact, isn't that what we see in the 20 -- comparing 2011, 2017, and 2021 irrigated lands datasets? They're pretty similar, aren't they? 179,000, 187,000 for Twin Falls?
A. Yeah, they're all kind of in that same range, plus or minus a thousand acres or so. So that suggests to me that what the Department's doing is reliable and repeatable and should be used.
Q. Okay.
MS. KLAHN: Mr. Director, it's 3:00 o'clock,

and I have probably 30 minutes more. We can push through or we could take our afternoon break.

HEARING OFFICER: Thanks for the suggestion. I think we should break. We've been at it two hours. Let's break for 15 minutes. Come back at quarter after.

(Break taken.)

HEARING OFFICER: Back on the record. We're recording again after afternoon recess.

Ms. Klahn.

MS. KLAHN: Thank you.

Q. (BY MS. KLAHN) All right. Mr. Sullivan, let's switch gears and talk about your opinions related to the incorporation of supplemental groundwater considerations into the methodology.

How does the Fifth Methodology Order -- how does the Fifth Methodology Order consider supplemental groundwater?

A. Well, I think it's one of the -- supplemental groundwater uses is one of the things that can be considered in the methodology in terms of a supplemental supply or in the acres that are irrigated with supplemental groundwater.

So there's a framework to allow that to be -- that sort of information to be utilized, but, to my knowledge, it never has.

Q. And supplemental groundwater is one of those things that the district court has said could be incorporated if the standard is clear and convincing evidence; correct? Is that your understanding?

A. Yes.

Q. Okay. Do you have an understanding of why IDWR hasn't attempted to incorporate supplemental groundwater use into the demand determinations?

A. Well, I think they've said that they just -- they don't have an ability to do that or good enough information to do that. And I mean -- and they've been saying that for 15 years. And, you know, we've been, you know, asking about it and suggesting that it ought to be incorporated.

In fact, in a -- that was one of my specific comments that I gave in the 2015 technical working group, is that they consider that. And I suggested that again in the latest one, the 2021 technical working group.

And they keep saying they don't have enough information. And I think -- I mean, we've heard some testimony earlier that -- or based on some questioning earlier suggesting that -- I mean -- and I agree with this, the Department has water rights information -- detailed water rights information, they have pumping

information. They have an ability to use that information to come up with reasonable estimates of supplemental groundwater use.

And, you know, it's not going to be perfect, but in this business nothing's ever perfect. And you can make reasonable estimates. And there's -- the problem is, now, by completely ignoring the supplemental irrigation we know there's a bias one way. We're not even attempting to correct that bias by considering the supplemental groundwater use that we know is occurring.

Q. And during the original Surface Water Coalition delivery call hearing in 2008, did the Surface Water Coalition members submit supplemental pumping information in relation to a request from the Director?

A. Yes. Director Gray requested a bunch of information from the Surface Water Coalition members; one piece of which was how much supplemental groundwater acreage they had or within their boundaries. And so the -- most of the members or all of the members did submit that information.

And I had tabulated that in my expert -- my original expert report. And that was information from them, so it seems like that would have been easy to use the information they submitted, but it wasn't used.

Q. Let's move on to talk a little bit about --

well, let me just close the loop on that.

Did you have time to do an evaluation of the supplemental groundwater use from the Surface Water Coalition?

A. No, I did not.

Q. Okay. So let's talk a little bit about the change in the Fifth Methodology Order from steady state to transient modeling.

How would you characterize the shift from steady state to transient groundwater modeling in the Fifth Methodology Order?

A. Well, it's a sea change in procedure, and it results in a drastic change in the priority date for curtailment compared to what was being done previously.

Q. Do you have an understanding of why IDWR made the shift in 2023 from steady state to transient?

A. Well, I think they gave three reasons. There were at least three reasons. One of which was that they had a better understanding of transient and steady state modeling and how they could be used in the methodology.

That struck me as kind of curious because -- and I didn't quite understand that reasoning, because everyone is well aware of the difference between transient and steady state modeling and the use of the modeling and -- in the methodology. So it didn't seem

like there's anything new there.

I mean, so -- and then a second reason they gave is that now we have -- the ESPAM model is a monthly model, it has monthly stress periods, and so now it can be used in a transient way. But we've had a monthly model for a long time, and -- so why all of a sudden it should be now used for transient instead of steady state, that didn't -- I didn't quite understand that.

And then the last one was also one I questioned, I guess. And that was that they needed to determine curtailment dates with the steady state -- or the transient model so that curtailment would provide a backstop in providing wet water to the seniors in the event that the juniors don't mitigate -- don't mitigate enough -- and don't mitigate enough to meet the shortage.

And, I mean, to me, I didn't -- I don't know -- that doesn't make a -- well, I don't agree with that, I mean, for a number of reasons. I guess one is that I think if there's -- I mean -- and I'm not a lawyer, obviously, but if there's a mitigation order, there should be an expectation that the juniors will comply with it, and if they don't, there should be penalties for not complying with it, or curtailment. And that's the way it works where I come from in

Colorado.

And then, further, it's -- curtailment as the mechanism for conjunctive administration is horribly inefficient. You know, especially for an aquifer as vast as this, you have to curtail so much pumping to produce relatively little amounts to the seniors, you know, where they divert it, so...

Q. So in the Fifth Methodology Order, which I'm sorry -- I'm sorry, in Exhibit 301, which is the April 1st As-Applied Order, the curtailment date, I believe, is sometime in 1953; correct?

A. Yes.

Q. And so how much -- if curtailment was the reason for imposing the transient model approach, how much curtailment would it require to produce the 75,000 -- approximately 75,000 acre-feet of shortage by curtailing to 1953 priority date?

A. Well, if I'm --

Q. Approximately?

A. Yeah. What I recall is that for that -- the curtailment run that Jennifer made to determine the 1953 curtailment date, she was curtailing, roughly, 700,000 acres of groundwater use and 1.7 million acre-feet of groundwater consumptive use. So curtailing 1.7 million acre-feet of consumptive use to produce

75,000 acre-feet to the near Blackfoot to Minidoka reach. So I didn't do that math, but that's a very, very small percentage of the water that's curtailed that's going to reach that reach this year.

Q. So if you curtailed 700,000 acre-feet in order to achieve 75,000 acre-feet in the Blackfoot to Minidoka reach and the total CU curtailed is 1.4 million acre-feet, what happens to the other 1.325 million acre-feet of curtailed consumptive use? Where does that show up?

A. I think those numbers -- those are -- the numbers we talked about, that's not the right numbers. They're actually curtailing 1.7 million acre-feet.

Q. Okay. So 1.7 acre-feet, sorry.

A. So they're curtailing 1.7 million acre-feet, so 75,000 acre-feet will show up in the reach this year, and the other -- was it 1.625 million acre-feet? -- will either come back to different reaches this year, different reaches of the Snake River, or it will come back this winter, or the majority of it is just going to come back in future years.

So that 1.7 million acre-feet will come back to the river, and so -- you know, just -- then it sort of begs the question, well, what's going to happen with that water? And it seems to me that that, potentially,

just provides a windfall to all these other reaches and users and later in time, and so you -- and that doesn't seem a very good use of the resource. And that's why curtailment as a mechanism of conjunctive administration is not done.

Q. So what is the alternative? Is steady state the alternative to curtailment -- I'm sorry -- is curtailment based on steady state the alternative to curtailment based on transient modeling?

A. Well, I think you can use the steady state model to get there, but ultimately the solution is, you know, what is done routinely in Colorado and some other places, too, is you allow the juniors to keep pumping and then you require them to mitigate for their impacts.

And, you know, to be -- and, like, in places like Colorado when they come up with those replacement plans that are either judicially or administratively approved, those replacement plans need to be, you know, tested and proven that they can operate in wet years and dry years and all in order to be approved.

And if they don't -- if they can't function that way or don't have a way to get them -- reliably get the mitigation water they need, then they're not approved and those water users don't get to pump. So that's the safety net. You know, that prevents the

seniors from being injured and is way more efficient of the resource.

Q. Is the impact from curtailment under a transient model run disproportionate because of the moratorium on new wells in the ESPA?

A. Well, I think the moratorium provides -- the fact that there's been a moratorium in the ESPA since the early '90s presents some additional facts that make -- that are compelling to the use of the -- continued use of the steady state modeling to determine the curtailment date. And that's because since that -- because of the moratorium, you know, there's been, essentially, no new wells approved that -- since that time that -- and if they have been, then they have to mitigate for their impacts.

So, essentially, all of the wells that, you know -- prior to the moratorium order have been operating for at least 30 years and most of those wells for much longer than 30 years. So you have a situation where the current and prior pumping of virtually all of the wells in the Snake River Basin has reached a near stead y state; and so, therefore, we can use steady state modeling to evaluate the current -- the impact of the current and prior pumping from the wells on the Snake River. And that, to me, is a -- would be a better

way to establish or determine the curtailment date, is going back to using the steady state modeling, because I think that is the correct way to do it.

Q. Can I ask you to turn to page 24 in your report, please.

A. Okay.

Q. And I believe this is a graph that Jennifer Sukow produced but that you incorporated; is that right?

A. Yes. I just cut and pasted this from one of her presentations that she gave to the -- during the November 28th, 2022, meeting in the technical working group.

Q. And this was actually something that was discussed in Jennifer's testimony, too, wasn't it?

A. Yes.

Q. Let's see here.

A. Is there a question about this?

Q. Yes, there is.

A. Oh.

Q. I'm just trying to find it in my notes.

A. Oh.

MR. FLETCHER: No pressure.

MS. KLAHN: Yeah, right.

Q. (BY MS. KLAHN) So based on this graph, the curtailment of pumping from wells junior to sometime in

the mid-1980s for steady state would produce 75,200 acre-feet of water in the --

A. Which graph are we looking at? Sorry, I might be looking at the wrong one.

Q. I thought it was on the graph on page 24 of your report. I'll withdraw that question.

A. I think that question you were asking me was about --

Q. Page 26?

A. Yeah.

Q. All right. Let's go to page 26 of your report. Explain what's shown here on the graph on page 26 related to how you could produce -- how one could produce 75,200 acre-feet of water in the river from curtailment under the steady state approach.

A. Well, okay, so what this graph shows -- and when I talk about this graph, I'll be talking mainly about the yellow line and the orange line. So the yellow line represents the results of the steady state runs that Jennifer made. And so what this graph shows is that along the bottom -- the axis is labeled "Water Right Priority Date," and that's basically the curtailment date that she simulates, and each one of these dots is a separate run that she made.

And then the -- so -- and then on the y-axis,

that's the amount of water that's produced at the near Blackfoot to Minidoka reach resulting from curtailment.

And so the orange line is -- for the transient run -- represents the amount of water that's represented in the first year, I think May 1 to September 30 from curtailment in the first year. And so that's when -- kind of squint a little bit. If you go to around 1953, and that -- the dot there is at about 75,000 acre-feet, and so that's where you go and you can figure out how much -- you curtail back to 1953, and in the first year, you'll get 75,000 acre-feet at the key reach.

And then -- and when you look at the steady state line, the yellow line, you can see that you only need to curtail back to sometime in the mid-'80s to get 75,000 acre-feet. And that -- that will be -- that would produce 75,000 acre-feet at steady state, so after 30, 40, 50 years it would take to get that much.

But that also represents -- that 75,000 -- another way you can look at that is that the current and -- the current effect or the current depletion to the near Blackfoot to Minidoka reach today caused by wells junior to the mid-1980s is about 75,000 acre-feet. That's their -- the impact of those wells' current and prior pumping. And so had those wells not pumped, there would be 75,000 acre-feet more in the river.

So I think that's sort of an easy way -- that's why I think the steady state modeling should be used, because with that way of thinking, you can say that, well, the -- that last 75,000 acre-feet of depletion is what created the shortage, and the users that are, you know, junior to the mid-'80s are the ones responsible or the ones that caused that and they should be the ones responsible for the mitigation. And, again, that's why I think steady state modeling is the right way, particularly in this situation, for determining the curtailment date.

Q. Okay. Thank you.

Let me switch gears and let's cover some responses you might have to testimony we've heard.

MS. KLAHN: Mr. Director, we're assuming that you prefer we put on rebuttal testimony to the extent we can in the case in chief, and so I just have a couple questions to him to react to other witnesses.

HEARING OFFICER: That's great. I think it will contribute to efficiency.

MS. KLAHN: Well, efficiency is what we're after.

Q. (BY MS. KLAHN) One of the discussions we had at some length yesterday, I believe it was, was the nature and extent of Twin Falls Canal Company return

flows.

Do you recall that?

A. Yes.

Q. And I think we talked to both Department witnesses about whether they were aware of the Twin Falls Canal Company return flows and how much they were, and there was not really anything conclusive, I think, from that questioning. But the Department maintains a database of return flows for Twin Falls Canal Company?

A. Yeah, I mean, for all of the return flows to the river that's -- you know, they've -- over the years, they've -- they or other agencies have instrumented some of these return places to the river, draws or places where water collects and gets back in the river, because that information has been used in the groundwater modeling. It's good data. It helps you differentiate how much of the reach gains are due to water coming on, you know -- reaching the water -- river from the surface versus water that's coming through the underground and back to the river. And that's helpful information for the modeling.

Q. For purposes of determining what's attributable to reach gains from the aquifer versus other sources?

A. Yeah, for calibration particularly, yeah.
Q. I want to hand you this and ask you to identify it. Mr. Sullivan, would you identify this.
First of all, have you seen this before?
A. Yes, it was prepared under my direction.
Q. Okay. And what are -- what's the source of the information on here?
A. It's listed in footnote 5 there. It's daily data that's downloaded from IDWR's Aqua Info database. There's the URL code there. And so we had heard testimony from Jennifer Sukow --
Q. Well, wait. Let me just lay the foundation here so we can offer it.
So the data on here was from IDWR's database. This document was prepared at your direction.
MS. KLAHN: Mr. Director, I'd like to offer this as a demonstrative exhibit showing the -- summarizing the data in IDWR's database related to Twin Falls Canal Company return flows since we've had so much testimony about that for purposes of clarifying the record.
HEARING OFFICER: You want to mark the document?
MS. KLAHN: Yes, please.
MR. FLETCHER 365?

MS. KLAHN: 365.
HEARING OFFICER: We'll mark the post exhibit.
COURT REPORTER: I'm sorry, what?
MS. KLAHN: Can we mark this as exhibit --
HEARING OFFICER: Mark it with an exhibit sticker.
(Exhibit 365 marked.)
MS. KLAHN: So I'd like to offer Exhibit 365.
HEARING OFFICER: Any objections?
Hearing none, the document marked as Exhibit 365 is received into evidence.
(Exhibit 365 received.)
Q. (BY MS. KLAHN) All right. Mr. Sullivan, you started to describe what 365 shows.
Could you do that now, please.
A. Yeah, so these are the annual summaries of the daily data that we downloaded from the IDWR database for the places where return flows are measured, you know, all along the Twin Falls service area from top to bottom. So they're all measurement points that are at or near the river at the bottom -- the lower end of Twin Falls near the river.
And they're color-coded, just for informational purposes, as the blue represents gauges that are on the coulees, or the kind of gullies that

intersect or go through or depressions that bisect -- or intersect a bunch of the canal service area for Twin Falls.

And then there's also -- the orange represents measurements that are actually on some of the tributaries that come through the Twin Falls area.

And then the gray is some other lines that are identified.

And then -- and for each of those in the footnotes there, we've identified specifically which gauges are in each of those different categories.

Q. So what's the difference between a coulee and a tributary gauge?

A. The tributary is, like, a known -- mainly a -- what I identify as a tributary.

Q. Like a live stream?

A. Well, yeah. Or a creek or something that actually comes through.

And so there are return flows that improve to these creeks that go into the river. And then there's other of these coulees that are really not, like, a main tributary, but just a low spot in the Twin Falls area where water collects and comes out.

Q. Okay. And then one more question.

This morning Mr. Barlogi testified that the

conversions to sprinklers in the Twin Falls Canal Company had not changed demand, I believe. And he had some testimony about how losses couldn't be reused, and that's why the conversion to sprinklers didn't change demand.

Do you have a professional reaction to that?

A. Yeah. I disagree with that characterization. Because, in my experience, anytime you can improve the on-farm efficiency, you can make due with less water.

Now, it is true that with less efficient use you can have more runoff that can be reused in lower parts of the system. And there is some of that that does happen in Twin Falls.

But the issue is: I've never seen a system where you can reuse everything. So inevitably some of that -- you know, the return flow from the first use gets away from you, you know, through the groundwater or otherwise, and it can't be reused.

So in that process, yes, there's use and reuse and maybe a third use, but you're losing water every time that cycle happens.

And you're always going to be much better off making more efficient use and basically -- than delivering more first-use water and less reuse water. That will always be more efficient.

And, yeah, there will be less overall delivery to the users, but that's the way it should be. They don't need as much water if they're more efficient.

And so, you know, from a consumptive use basis, you can meet the same consumptive use with more efficient on-farm operations and, therefore, less water being diverted at the river heading.

Q. Okay. I think that's all the questions I have for you right now.

HEARING OFFICER: Thank you, Ms. Klahn.

Cross-examination?

MR. FLETCHER: Yeah, I guess. I hadn't thought of that.

Would it be better to see if there's any other groundwater questions first before I cross-examine?

HEARING OFFICER: Well, I was assuming that Ms. Klahn's -- this was Ms. Klahn's witness, and there wouldn't be follow-up, but I'm willing to ask that question.

Are there any of the groundwater user groups that want to question Mr. Sullivan further?

I see heads shaking no.

Mr. Fletcher, are you examining?

MR. FLETCHER: Yes. Thank you.

///

CROSS-EXAMINATION

QUESTIONS BY MR. FLETCHER:

Q. Good afternoon, Mr. Sullivan.

A. Good afternoon, Mr. Fletcher.

Q. Nice seeing you again.

A. Likewise.

Q. We have participated in several of these hearings over the years.

You mentioned in your direct examination that you've been involved in this water call since 2005, I guess; right?

A. Yes.

Q. And in 2007's hearing before the hearing officer, you rendered several opinions in your expert report; isn't that correct?

A. I did.

Q. And one of those opinions was that there was no injury occurring to the senior users; isn't that correct?

A. Not quite. I think I'd identified some limited instances where there was some shortages.

Q. You gave written direct testimony in that proceeding; is that correct?

A. Yeah, I think we did that.

Q. What's that?

A. Yes.
Q. And I believe the very last question you were asked -- I'll read it to you and see if you remember this -- was: "Did the Surface Water Coalition suffer injury during the 2005 and 2006 irrigation seasons?"
And your answer was: "No. The water budget analyses that are summarized in Exhibit 3023, together with the deposition testimony of the SWC managers, shows that the SWC members were not short of water in 2003 and did not suffer injury" -- or excuse me -- "2005 and did not suffer injury in 2005."
Do you recall that opinion?
A. Not specifically, but I'll take your word for it.
What I was referring to, I think, was I did an analysis over that longer period, and there were a handful of small shortages during that time.
Q. So your opinion in that case, ultimately, was not accepted by the hearing officer; is that correct? Your opinion concerning injury.
A. I don't recall.
Q. Well, did the hearing officer find that there was no injury?
A. No. No, he didn't. He didn't find any --
Q. He found there was injury; correct?

A. Right. Well, he found -- I don't remember the details, but he found that they needed to institute a methodology to address impacts and shortages.

Q. And you also rendered an opinion that the Department should use some sort of achievable farm efficiency formula; isn't that correct?

A. Yes.

Q. And that was rejected as well; correct?

A. At that time, yes.

Q. And you rendered an opinion that there should be no minimum carryover requirement in the Methodology Order; isn't that correct?

A. I think for purposes of -- well, in fact, yes. Yep.

Q. And that was rejected as well; correct?

A. Yes.

Q. And you also -- in your opinion, Twin Falls Canal Company's diversion rate should have been five-eighths of an inch per share; correct?

A. I think that's what it was at the time. Right?

Q. Well, the hearing officer accepted that.

Do you recall this?

A. Yes.

Q. So if you don't remember this, I'm not trying

to stump you here.

A. I know.

Q. But that was overruled by Judge Melanson in July 24, 2009; correct?

A. I'll take your word for it.

MR. FLETCHER: I'll just direct the Director toward the July 24th, 2009, order on petition for judicial review issued by Judge Melanson, page 31.

Q. (BY MR. FLETCHER) You also advocated for an industry standard when it came to determining whether the projects were being efficient; correct?

A. Yes.

Q. And that was rejected as well; correct?

A. Is that the same question you just asked me before?

I was advocating for using industry standard efficiencies and the -- as I recall, the hearing officer decided he didn't have the ability to differentiate that information.

Q. So you agree that that was rejected by the hearing officer?

A. Ultimately, it was, yes.

Q. So in all of these call proceedings, you have been representing groundwater pumpers, correct, the cities?

A. Yes.
Q. And you feel that it's your position to minimize the amount of mitigation that's required by a groundwater pumper?
A. No. My -- I feel like I have a role here to help assist the Department in determining that if mitigation is required, that it's required in amounts that are really needed to alleviate real shortages.
Q. Well, let's talk about that for a minute.
One of the things you talked to your counsel about was the change by the Fifth Methodology Order As-Applied Order using transient analysis to determine a curtailment date versus steady state; correct?
A. Yes, we talked about that.
Q. Right. And you agree, I mean, in principle, that all groundwater rights on the Eastern Snake River Plain are junior -- or substantially all of the groundwater rights on the plain are junior to all of the surface water users; is that correct? Junior and prior?
A. Well, with that -- with that "substantially" qualifier.
Q. Okay. So your opinion is that steady state modeling should be used to determine the priority date of curtailment?
A. Yeah.

Q. Does steady state modeling for a curtailment date mitigate in-season demand shortfall?

A. Yes, if -- I mean, the modeling itself doesn't, but the modeling identifies the user -- the groundwater users that are responsible for causing the shortage, and it's those users that should mitigate the shortage.

Q. Well, let me ask my question a different way: If steady state is used in the modeling to determine a curtailment date, will the amount of shortfall determined by the order be fulfilled in that year?

A. If you are using curtailment for the mechanism for conjunctive administration, it would not.

But that is not the way you conjunctively administer groundwater. The use of the model to determine the curtailment date should be determining -- the purpose of that should be determining the pool of users that are responsible for mitigating the impact. And the mitigation is what should be alleviating the shortage, not curtailment. Because, for the reasons I just talked about, curtailment is a very inefficient way of administering groundwater, and that's why it's not done in the West.

Q. That's a long answer to a "yes" or "no" question.

But the real point here is that steady state use will not provide water in-season to the injured party, the amount of water, the amount of injury?

A. Not if -- it would not if you only curtail back, like, to the mid-'80s. In the example I was giving, in the first year it won't.

Q. Do you agree with Jennifer Sukow's information that was on the chart that you referenced in your report, that only about 15 percent of the shortfall would be realized in the first year of mitigation?

A. I think the percentage is actually smaller than that. Because I think that 15 percent refers to the percent of water that ultimately will show up in that reach.

But if you look at that -- at the percentage as the percentage of the water curtailed, it's actually a much smaller percent.

Q. Well, I'm talking about the amount of injury that's determined.

According to her chart, 15 percent of the injury will show up in the first year of curtailment using steady state; correct?

A. Well, that's another way of asking the question you asked me before. Yeah, it won't -- the full 75,000 acre-feet would not show up in the first

year.

Q. About 15 percent will show up in the first year; correct?

A. If you only curtail back to 1980 -- the mid-'80s.

Q. Okay. So, in your opinion, an injured senior is only entitled to receive about 15 percent of the shortfall resulting from injury in one year in time, location, and amount.

MS. KLAHN: Objection; mischaracterizes testimony.

HEARING OFFICER: This is cross-examination. Overruled.

THE WITNESS: I think you mischaracterized my testimony.

Q. (BY MR. FLETCHER) What a surprise. Whose testimony, I'm not sure whose testimony?

A. Well, if I may explain.

Q. Sure.

A. In my mind, the proper way of conjunctive administration is to determine who has to mitigate, and we shouldn't be using curtailment as the way to mitigate, as the way to deliver the water to the seniors. We deliver them storage water, you know, the other kinds of mitigation that have been determined

previously. That is more targeted and more efficient, and it allows for a better use of the resource, it keeps the senior whole. And the curtailment analysis is just to determine who has to -- who has to provide the mitigation water, but the Surface Water Coalition gets their water.

Q. Yeah, I'm not disagreeing with you, and I don't think anyone is that if someone has a mitigation plan in place and it's effectively operating, then we're not talking about those people in this hearing; correct?

In fact, your client, the City of Pocatello and the other cities, have an effectively operating mitigation plan; correct?

A. They do.

Q. Right now?

A. Yes, they do.

Q. They've never breached that plan, have they?

A. No.

Q. They're not facing curtailment as a result of this hearing?

A. Well, they could ultimately if the curtailment -- or the shortage requirements become so much that it strains their mitigation supply. And so that's why it's in everyone's interest to make sure that the mitigation amounts that are necessary are truly

necessary to meet real shortages.

Q. Well, their obligation in their plan is capped at 9,000-some acre-feet; correct?

A. Yeah, but the plan doesn't last forever.

Q. So 30 years from now, or whenever that plan runs out, that's your concern for your clients?

A. That's one concern. I think our clients are interested in the viability of agriculture in the whole area, and so, you know, part of that viability is enhanced by maximizing the use of the resource.

Q. So I'm going to get back to the question you were working around earlier.

In your opinion, a senior should only receive 15 percent of the injury at the time of injury by using steady state; correct?

A. I absolutely disagree with that characterization.

Q. But that would be the result if steady state was used for curtailment?

A. If that was used and you didn't require those users to mitigate, you just were relying on curtailment alone, you would be right. But that's not what would happen. And if those users can't mitigate, then they should be curtailed and not allowed to operate at all.

And that whole -- I mean, in my experience in

Colorado, that whole -- that creates an incentive for these users to develop these plans and mitigate, and that's what I've seen happening in Idaho for the most part. I mean, most users are on a plan; right?

Q. Isn't every user in this room in a mitigation plan?

A. Well --

Q. Every groundwater user in this room is a party to a mitigation plan; is that correct?

A. Yes, but those plans aren't necessarily forever, and some I understand are being renegotiated; and so, I mean, there's changes afoot.

Q. So as I understand your testimony, if they breach those plans, then they should be curtailed?

A. Yeah. Well, and even those plans -- yes, if they breach the plans, they should be curtailed, and those plans should be -- you know, should be reliable plans so that the risk of breaching is very low and doesn't fall on the shoulders of the seniors.

Q. A steady state use of the model does not predict an instantaneous response to the reach in question; correct?

A. Well, no run does.

Q. Now, as I understand your testimony about the 1980s wells, first of all, none of those wells from the

1980s have been curtailed; correct?

A. Today.

Q. Today.

A. I don't know. I thought the -- I mean, I was out of the country for a while, but I thought that the Director had -- there was an order that he was going to curtail as of sometime in May. And maybe I just -- I don't know what happened since then.

Q. I missed that order the Director issued curtailing people to the mid-1980s.

The bottom line is that no one that's had a mitigation plan in place, none of the parties to this proceeding, have been curtailed; correct?

A. I think that's right.

Q. So for you to talk about if pumping had never occurred since 1980s, then 75,000 acre-feet would be in the reach this year and there would be no injury, that's just fantasy, isn't it?

A. No. That's just a different way of saying that the last 75,000 acre-feet of depletion that created the shortage was caused by the wells junior to the mid-'80s, and, therefore, they should be the ones responsible for mitigating it because they caused the problem.

Q. So your position, then, is only those wells

since the 1980s should be required to furnish all of the injury determination this year?

A. For this year. And next year if the shortages is more than -- maybe the curtailment date goes to, say, 1970, then that pool of users should have to replace in that year.

Q. And if they can't furnish the water or won't enter into a mitigation plan, then what?

A. I think -- well, the way that -- I don't want to get too far out in front of my client or anything, but in Colorado, you have -- you can't pump unless you have a mitigation plan. So I don't know if that's -- that's a solution, maybe there's other ways, too, but that's the way it works in Colorado.

Q. Yeah, I'm not disagreeing with that idea of yours. Trust me. I like it. But it's not what Idaho uses; isn't that correct?

A. That's correct. But my understanding also is that there's -- the amount of users that are operating without a plan is relatively small.

Q. So the -- under your 1980s theory, the 19 -- for that water to appear in this reach, the 75,000 acre-feet injury, the 1980s water rights and junior to that would have to be permanently curtailed; correct?

A. No. They would have to provide mitigation.
Q. Or provide mitigation?
A. Well, yeah, provide mitigation is --
Q. And if they don't provide mitigation, they would have to be permanently curtailed for that amount to appear in the reach?
A. The threat of curtailment is the stick to keep them mitigating.
Q. You know, you just won't answer the question.
The question is: If they don't mitigate, if they don't mitigate, your theory is they would be permanently curtailed so that that 75,000 acre-feet would show up in the reach; correct?
A. The point of curtailment is that they're not mitigated, and I'm not really looking at later stuff as when the water shows up or anything like that.
Q. Let's talk about your Colorado plan that you suggest to the Director in your report on pages 24 and 25.
You've explained this two or three times that, under Colorado, the water user -- groundwater user is required to have a plan in place before the season ever starts; correct?
A. Yes.
Q. And it has to be approved?

A. Well, and I should say, not everywhere, but in most places in Colorado, they have to.

Q. And what are those plans called in Colorado? They're not mitigation plans, they're augmentations?

A. There's augmentation plans that are approved by the court, and then they have substitute supply plans that can be approved by the agency in some limited instances.

Q. And our conjunctive management rules don't talk about augmentation plans or substantive water plans; correct?

A. Yeah, but I've always viewed a mitigation plan as functionally the equivalent.

Q. So as I understand -- the way they do it in Colorado, those plans have to be in place before the irrigation season. Not only the plan has to be in place, but the supply of mitigation water has to be in place before the irrigation season; correct?

A. Yeah, or, you know, reasonably certain that it can be there.

Q. And that depletion caused by that groundwater user has to be delivered in time, location, and place under that replacement plan or whatever it's called?

A. Sufficient in time, location, and amount to -- and such that it prevents injury. So it doesn't have to

exactly match the depletions, but it needs to get to the user before they're injured.

Q. And those plans do not cover 100 percent of the depletion?

A. Right. Because at times when there's -- the seniors have enough water, then there's not a mitigation plan.

Q. So it -- how is it determined each year how much should be covered under the replacement plan?

A. Well, there's routine accounting that's performed by these plans that is submitted, and it depends on, you know, how much water is available, how much the seniors are diverting, what the shutoff date is of the water rights and who's short and that sort of thing, and what depletions the juniors are creating. And it's become routine.

Q. Okay. When you say it's routine, who's doing that accounting?

A. Well, the accounting is done largely by the users and, you know, standard mechanisms have developed for reporting that information, and so the users do most of the work. It's submitted to the agency in a certain format so that it's relatively easy for the agency to review it, and it's also transparent because the users can review each other's accounting and make sure it's

all kosher. And it ends up working -- it's working very well, actually.

Q. So in addition to that requirement of having the water in place before the season starts, under the Colorado model that you're talking about, or method, those groundwater users are required to have telemetry on their meters or some sort of way to measure their diversions?

A. Well, similar to Idaho, there's -- in most areas, there's -- well, the groundwater users have to measure their use for -- sometimes they're allowed to calculate it, you know, with our data, but, yeah, there's typically measurement requirements.

Q. How often is it measured in Colorado?

A. Well, I mean, they're typically like a continuous meter, totalizing flowmeter, so it's measuring continuously. And then the reporting for these plans, it's typically monthly or annual.

Q. Yeah. Aren't there plans that require daily reporting?

A. For -- maybe a few, but not -- I mean, they may submit daily data, but ultimately, that's part of the -- you know, as input to the accounting. But ultimately, it's rolled up into sort of a balancing period that may be monthly or annual that they have to

balance --

Q. So monthly is more common than daily; is that what you're saying?

A. Well, it kind of -- it depends on the situation, you know, that -- yeah, it's kind of situation specific.

Q. To your knowledge, are the groundwater users in Idaho required to report, monthly, their diversions?

A. I don't think so, but I don't know.

Q. And aren't those meters calibrated every two years by a certified inspector?

A. In Colorado.

Q. In Colorado?

A. I think that that varies by basin.

Q. But, overall, those components of the Colorado plan, that's what you're recommending the Director adopt, that you've just talked about?

A. I mean, maybe some components. I haven't really thought that far ahead, but I think the -- there could be a mechanism developed that protects the senior and has, you know, accounting based on measured use and those sorts of things that could work here.

Q. Are all groundwater users in compliance with their replacement plans?

A. Where?

Q. In Colorado.
A. For the most part, yeah, or they get curtailed.
Q. So when you say they're curtailed, how are they curtailed?
A. That the sheriff comes out and tags their well and enjoins them from pumping.
Q. Okay. Does that have -- before that curtailment takes place, do you have to go through some kind of administrative proceeding?
A. Yes.
Q. I'd like to talk to you about your acreage just for a minute.
I'd like you to open page 19 of your report.
Exhibit 347A, I think; is that right?
And as I understand your recommendation to the Director, you're recommending that he use those acreage numbers that are in the column labeled, "2021 Acres"; is that correct?
A. Sorry. What page are you on?
Q. Page 19.
Let me double-check. Excuse me. Page 18.
A. Yeah. I mean, that was the most recent one or -- but, you know, the numbers are similar.
So I think that this would be a good place to

start for coming up with the acres.

Q. Yeah, it says in the report: "In my opinion, it would be more appropriate to use the 2021 acres for purposes of the demand calculations."

Correct?

A. Yeah.

Q. Have you totaled those acres in 2021 -- 2021?

A. And when I said that, I should have been clear. I meant for Burley and Minidoka and for Twin Falls.

Q. Well, that's not what your report says.

A. I should have been more clear.

Q. So that's a mistake. You only want to use --

A. Well, they shouldn't be able to -- you know, if they're irrigating more than their shapefile or more than they say they're irrigating, then that should be a consideration as well.

Q. Well, I don't disagree with you, I'm just reading what your report says.

A. Okay. I was --

Q. Because those 2021 acres total over 618,000 acres; correct?

A. Well, there's -- if you look at, like, North Side -- I used to know the answer to this -- but there's some -- there's a reason why North Side says 220

in 2021 and not 154.

Q. Okay. My question is: The 2021 column adds up to over 618,000 acres; correct?

A. I haven't done the math.

Q. Well, the math can be done, but I would advise you that if you do the math, you're showing an increase in acreage of about 57,000 acres by using 2021?

A. I think using the actual acreage would reduce the overall acres.

Q. What goes into determining crop water need?

A. Irrigated area, the crops that are being grown, and the weather.

Q. And is the crop mix an important factor of that crop water need?

A. Yes.

Q. And, in your opinion, the more current that information is, the better?

A. Yes. I mean -- yeah, I mean, assuming we're trying to figure out what the crop water need is today, we should be using current data.

Q. Yeah. If you had 2023 data available, it should be used; correct?

A. Yes.

Q. And how is the Department doing that now; do you know?

A. Yeah. I think they're -- they're using what they call CDL information. So it's remote sense crop data. And that data is not available in real time, so -- or at least not readily available in a form it can be used. So I think they use data from the previous year.

Q. Are they averaging previous years.

A. Oh, you're right.

Q. Yeah, I'm not trying to stop you --

A. No, you're right.

Q. A lot of details in this stuff.

A. Yeah.

Q. They're averaging about three years to determine what this year's crop data mix is; is that correct? Or is it more than that?

A. It's -- yeah, three to five. I don't remember exactly.

Q. I'd like to talk to you about project efficiencies. A little bit of reality instead of theory.

You toured these projects back in 2005 or '06. I don't know what year, but...

So you're familiar with how they're actually laid out on the ground; correct?

A. Yes.

Q. And, Twin Falls, who -- everybody's after Twin Falls in this proceeding. Twin Falls has, what, 100 miles of canals and about 1,000 miles of lateral ditches and other parts of its delivery system?

Sound right?

A. I don't know those exact statistics, but it's a large irrigation system.

Q. And when they design a system like Twin Falls, aren't they designing that system to carry peak demand, the amount -- the largest amount of water they need during the year to grow a crop?

A. They should be.

Q. And isn't that typically occurring in the months of June, July, and August when it's the hottest and all of the crops are growing, generally?

A. Typically.

Q. So your review, and I think the Department's review as well, shows when the demand is the highest and when the canals are near capacity, they're the most efficient. Wouldn't you agree with that? The project is most efficient?

A. I think that's what the -- the results, those monthly -- actual efficiencies that I calculate that are crop water need divided by diversion are at their highest in the mid-season.

Q. Right. And that's when the project efficiency is also the highest; correct?
A. And the reason that is, is because I think they're probably overdiverting in the other months when the demand is lower.
Q. That's what I want to talk to you about.
In the spring and fall, they still have to make deliveries to water users; correct?
A. Depending on how the company operates. But, yeah, I mean, they -- there's different mechanisms for ordering water, and they have to try to meet those deliveries.
Q. And using Twin Falls as an example, they may have to be delivering water still down 100 miles of canals and a 1,000 acres of lateral ditches?
A. Yeah.
Q. Even in the spring and fall; correct?
A. Correct.
Q. Now, that doesn't mean that every farm on that project is irrigating at that time; correct?
A. In the fall?
Q. In the fall or even in the early spring.
A. Well, the demand is generally less in the fall and the early spring.
Q. Some crops have been harvested by the fall;

correct?

A. Correct.

Q. But they still have to convey water to all their other water users on the system; correct?

A. But, overall, the demand is lower.

Q. I'm not talking about the demand; I'm talking about the fact they have to still convey water through their system to all other users.

A. Yeah, but the amount that's peeled off on the way is less because the demand is less.

Q. Okay. The headgate deliveries are less, is what you're talking about; correct?

A. Uh-huh.

Q. But you still have to push all that water through a system that was designed to carry the peak load of June, July, and August; correct?

A. Of course.

Q. And doesn't that effect those efficiencies in spring and fall?

A. You, typically, can see some lower efficiencies in the spring and fall, but I think to the extent to which these efficiencies have gotten so low are unreasonable.

Q. What I just described to you is true for almost all open-canal surface water systems; correct?

Their peak efficiencies -- project efficiencies tend to be in the midsummer, and their spring and fall efficiencies typically are lower?

A. Typically. But then the issue is: How much lower, okay, in the shoulder months?

Q. Well, Twin Falls -- do you know how many acre-feet per acre it delivers or that -- excuse me -- how many acre-feet per acre does Twin Falls divert at the Snake River to deliver to it's 180- or 90,000 acres, whatever we're talking about?

A. What, 1.1 million divided by --

Q. I'll just throw a number out there, and you can tell me if you disagree.

Around 5.8 acre-feet, something in that neighborhood?

A. We can use that for an example.

Q. And you believe that's an unreasonable amount of acre-feet to deliver -- whether it's 180- or 190,000 acre-feet -- over a system that's -- conveys water through, roughly, 1100 miles?

A. Well, I don't think you look at it that simply. And that's -- you would look at it in more detail.

Like, I've done that in the past, and I think that more detailed look shows that they're typically

diverting more than they need to.

Q. Well, it's my understanding --

A. And more than they -- and more than they would need to in comparison to -- in my experience, compared to other large irrigation systems that operate more efficiently.

Q. So what other irrigation system do you know that delivers water to close to 200,000 acres through lava soils and stretches -- well, you heard Mr. Barlogi talk about 10,000 acres covering, roughly, 15-square miles.

I mean, what other system are you talking about?

A. Well, there's -- I mean, I just got through with a long litigation in Texas v. New Mexico where, you know, analyzing the irrigation operations under the Rio Grande project. And those are huge systems, very long, hundreds of miles long, and they operate more efficiently than Twin Falls does.

Q. Have you looked at other irrigation systems in the Eastern Snake River Plain?

A. Well, all the Surface Water Coalition members.

Q. Have you looked at others up the river?

A. Not in this level of detail.

Q. Do you have any idea how many acre-feet per

acre those systems divert?

A. Well, they're not calling curtailing juniors, though.

Q. I understand. But you're talking about an industry standard or a reasonable diversion rate.

A. I'm talking about industry standard in the situation where there's conjunctive administration and curtailment going on.

Q. What is this industry standard that you're talking about? You don't put it in your report. What is the industry standard for Twin Falls Canal Company?

A. I don't understand the question.

Q. In your report, you say Twin Falls should be measuring against an industry standard; correct?

A. Well, I think when I use that terminology, I mean the reasonableness of their operation, vis-à-vis their irrigation efficiencies and all should be analyzed in an industry standard way where the efficiencies that they should be expected to operate at before juniors are curtailed, for their benefit, should be based on, you know, their reasonable conveyance efficiencies. And, you know, their conveyance efficiencies and conveyance losses are knowable. And the amount of waste that is running out, you know, just gets spilled through the waste gates or runs out into the canal is knowable.

And there are industry standards that large canal systems operate under with -- yeah, I agree with, you know, what Jay was saying, that there is a certain amount of waste that has to happen to operate these large systems; but there's also a limit or a point at which it becomes unreasonable. And it's certainly -- it's easier to operate a canal system with more waste. You don't have to manage it as carefully.

But I think in a situation of conjunctive administration, there should be a reasonableness test before you curtail others.

So that's the conveyance efficiency piece. And then there's the on-farm efficiency piece, and industry standards on that is that there's certain efficiencies for gravity irrigation, sprinkler irrigation, that the users should be operating up to before juniors are curtailed.

And as I testified earlier, I'm not saying they have to, it's just that if you're requiring mitigation and curtailment, there should be an obligation in the calculation that you don't calculate a shortage until they are operating at that level.

Q. And in the 2007 hearing, the hearing officer and the Court found that the Surface Water Coalition -- their operations were reasonable; isn't that correct?

A. I think the -- they did. I think the hearing officer chose not to engage in all the details of the analysis.

Q. Okay. So your -- the stuff you're talking about right now was rejected by the hearing officer?

A. Yes.

Q. On page 12 of your report, you make a statement where you say: "Declines in the average project efficiencies are due to these systems not being managed as well as they were in the past."

What facts do you have to back that up? Have you -- do you have any evidence that the projects are not being managed properly?

A. Well, that's -- so that's based simply on that -- I forget the figure, but the figure where I had tabulated the average efficiencies that I found -- actual efficiencies -- you know, crop water need divided by what they're actually diverting -- from my analysis using the data from, what is it, 1990 to 2006. And so that's -- that was a set of actual efficiencies for each of the members.

And when I -- and when those actual efficiencies are now computed again with the more recent data, they're actually lower. And so, you know, what has changed that they should be lower and one -- you

know, apparently, they're not being managed as well because they're having to divert more water to meet their demands than they did in the past. So that was the basis for that statement.

Q. And you heard Mr. Barlogi's explanation for that; correct?

A. That they're converting to --

Q. Well, first of all, they aren't diverting that much more water, are they, at Twin Falls Canal Company?

A. When you do the math, the efficiencies are lower.

Q. They've been -- you saw his chart where it showed he was diverting about 1.1 million acre-feet for I don't know 20, 30 years?

A. Well, but it goes up and -- you know, about -- but it goes up and down --

Q. Right.

A. -- and it's been more of late. I mean, that's why the baseline year has been going up.

Q. So that's an analytical analysis you did to come up with that determination they're not being managed as well. It's not based upon any facts; correct?

A. Facts?

Q. Dealing with observations of management?

A. I haven't done that.

Q. Do you believe that the Methodology Order should be used to protect seniors from injuries caused by junior diversions?

A. Yes.

Q. Do you agree that if injury is determined, the shortfall should be supplied in time, location, and amount that season?

A. Well, I still believe that they really shouldn't really have to pay it back. You know, make -- pay back the depletion until, you know -- it could be sometime later if the users still have storage available. But under the methodology, there's some constraints on that. So I mean, if we're working within that constraints of the methodology, then, yeah, they should provide the water in the season or at the time of need.

Q. Thank you.

HEARING OFFICER: Mr. Thompson, I assume that Mr. Fletcher's cross-examination was sufficient, or do you want to ask some questions as well?

MR. THOMPSON: I have a few, Director, if that's okay.

///

///

CROSS-EXAMINATION

QUESTIONS BY MR. THOMPSON:

Q. Good afternoon, Mr. Sullivan. Travis Thompson for A&B Irrigation District, et al.

A. Good afternoon, Travis.

Q. Just a couple of questions. Kent covered quite a bit, so I won't go back over that.

On page 6 to 7 of your report, you talk about -- I think you do a lot of comparison of an average year of diversions looking at 2000 to 2021; is that correct?

A. Yeah, that's what the Department did.

Q. And you just kind of compared that to the prior baseline year of '6/'8/'12?

A. Yeah, I was just basically stating what the Department did for that particular piece of that.

Q. So if we're looking at an average diversion, would you agree that that average diversion does not meet the methodologies criteria of an above average year of diversion?

A. The '06/'08/'12?

Q. I'm just -- whatever average we're talking about. We're just looking at a straight average.

A. Yeah, as I testified earlier, I mean, if you still just use 2000 to 2021, it's 40 acre-feet short of

being above average.

Q. And the criteria in the order requires that you're above average diverting; would you agree?

A. It does.

Q. And are you familiar with the order on judicial review of the Methodology Order issued by Judge Wildman back in 2014?

A. I'm sure I read it.

Q. I guess would you agree that an average year of diversion does not meet the standard that he approved?

MS. KLAHN: Objection; the document speaks for itself.

THE WITNESS: I don't recall exactly --

HEARING OFFICER: Just a moment.

I'll allowing questioning in this area. I think it's important. If there's an objection, it's overruled.

Q. (BY MR. THOMPSON) I'm just curious. Arguments made in that case by Pocatello and IGWA were requesting that an average year be used.

Were you aware that those were rejected by the Court?

A. I'll take your word for it.

Q. I guess would you agree that the average of

the combined diversions for all Coalition members is not reflective of a standard of an above-average year for an individual Coalition member?

A. Yeah, I mean, that's different. It seemed like the methodology doesn't require it to be done user by user.

Q. And it's not average whether it's the Coalition or if it's a single user; is that correct?

A. I'm sorry, can you say that question again, please.

Q. The methodology does not require an average year; isn't that correct?

A. Above average.

Q. Yes.

A. Uh-huh.

Q. So you talked about increased diversions the last few years. Would you turn to Exhibit 300. I think that's the Fifth Methodology Order.

Could you turn to page 7, Mr. Sullivan.

A. Okay.

Q. And what is that table depicting?

A. The graph here?

Q. Yes.

A. It says: "April Through September Growing Degree Days."

Q. So would you agree that warmer climatic conditions could contribute to increased diversions in recent years?

A. They could.

Q. And based on that graph, have we seen a greater number of years with growing degrees higher than that average than the years prior? I'm going to look at, like, 2012 through '21.

A. Yeah, there's more years above average.

Q. How about more water consumptive use crops? Could that contribute to greater demand?

A. It could.

Q. So you talked about 2022 in your report. Would you agree that was a year of limited water supply for certain Coalition members?

A. I don't recall.

Q. Are you aware of reduced deliveries by certain Coalition members in 2022?

A. Reduced delivery?

Q. Yes.

A. I haven't studied that 2022 diversion data in detail.

Q. Or shortened irrigation seasons?

A. I don't know.

Q. So if that were the case, if those certain

members had reduced supplies in 2022, reduced deliveries, shortened irrigation seasons, would you agree that that year would not meet the Methodology Order's criteria for a baseline year?

A. I don't think I was suggesting that 2022 be a baseline year, but if I -- it could be used in computing the average over the period.

Q. Right. Which is not used by the methodology?

A. Well, the methodology does require, as I understand it, a computation of some average with which the baseline year is then compared to, to see if the baseline year is above average.

Q. Yeah, I think the criteria we talked about, it needed to reflect a year of above average to protect the senior at the outset?

A. Right.

Q. So would 2022 be above or below average?

A. I think it's probably below average, but maybe -- I don't know if I misunderstand or there's some misunderstanding, but I didn't propose that 2022 be a baseline year.

Q. No, that wasn't my question.

A. Oh, okay.

Q. Turn to page 7. I just have a statement I wanted to ask you about -- back in your report, I'm

sorry, Mr. Sullivan.

So you make this statement about Twin Falls Canal Company's, I'll quote, legally established delivery rate.

Do you see that?

A. Yeah, on the second-to-last paragraph.

Q. I think you testified earlier today that you're not an attorney; is that correct?

A. That is correct.

Q. So would you agree that you're not qualified to give an opinion on what the legally established delivery rate is?

A. Well, I can -- I'm not a lawyer, but I can read documents and see where information comes from.

Q. So you talked about looking at the Unit B part of the A&B project. Do you remember that testimony? I think it's in your report as well.

A. Yes.

Q. And would you consider that project to be similar to a large open canal system in Idaho?

A. I mean, there's some similarities, but one difference is that the distance between the point of diversion and the point of delivery is typically pretty short, and there's some open canals up there, but there's a lot of piping too.

Q. And that system has a number of groundwater wells; do you recall?

A. I think at the time it was fully supplied by groundwater. I think maybe they get some surface water now.

Q. So I'll represent probably over 180 wells delivering water to individual farms.

Would you agree with that?

A. That sounds right.

Q. And so these large canal systems that we're looking at for the Surface Water Coalition, would you agree that they have a large diversion point at the Snake River not over hundreds of individual points of diversion?

A. Yes.

Q. And you talk about the Director's order in that case. Did you agree with the Director's and hearing officers' recommended diversion rate for A&B at three-quarters of an inch per acre?

A. No. I think that's probably too much.

Q. So you disagree with the finding and the order?

A. Yeah, I don't -- I haven't studied that part of the order in quite a while, so I'm a little fuzzy on that piece.

Q. Is the requirement for a water user to put water to beneficial use different when you are making a call as opposed to not making a call?
A. I think so, yeah.
Q. And is that based upon your experience in Idaho or other states?
A. I would answer in the context of Idaho, that in the context of the conjunctive management rules and the decisions that have been made, and all, that they're expected to be operating reasonably and without waste before they are curtailed -- or before juniors are curtailed on their behalf.
Q. And does that apply to surface-to-surface water right administration?
A. I don't know.
Q. So is a diversion rate of 5 to 7 acre-feet per acre reasonable for large open canal systems in Idaho?
A. It depends. It depends on what their conveyance losses are and what their on-farm irrigation application practices are.
Q. You have a per-acre-feet, per-acre standard as an industry standard?
A. No.
Q. Or would it be different for every entity?
A. It would vary.

Q. I'd like to talk to you about your supplemental groundwater testimony in your report, pages 20 to 21.

And you represent that table was provided by the Surface Water Coalition; is that correct?

A. Yes.

Q. And do you know if that information related to potential groundwater lands within their project or specific lands that were overlapped with surface water as well?

A. I don't remember the specifics of that.

Q. So would you agree that some of these projects cover vast areas of certain counties in southern Idaho?

A. Yes.

Q. Not every one of those users may have a surface water right; is that true?

A. That's true.

Q. Some may have groundwater?

A. There may be, uh-huh.

But I think that this information was represented as supplemental groundwater acreage by the canal companies, to my recollection.

Q. Have you compiled any information on supplemental groundwater rights since 2007?

A. No.

Q. Are you aware of any groundwater right transfers since that time?
A. Just in the ESPA.
Q. Yes?
A. Yes.
Q. Would that change the analysis of supplemental groundwater available within certain projects?
A. Yes. And I don't -- I wasn't necessarily advocating that these values be used, but they were put in here as an example that this information has been considered before and, for whatever reason, hasn't been considered for a long time. And if it is to be considered, would it make sense to use more recent data.
Q. How about groundwater rights enrolled in CREP since that time?
COURT REPORTER: Wait, I didn't hear that. Can you repeat that?
MR. THOMPSON: Groundwater rights enrolled in CREP, C-R-E-P.
THE WITNESS: I mean, if they're not delivering groundwater, then I don't think that should be considered as an alternate source. I suppose the lawyers may have some reason that legally it should be considered, but...
Q. (BY MR. THOMPSON) How about groundwater

rights used in mitigation plans, have you looked at those?

A. So what do you mean by that?

Q. Well, I just want to know if -- you haven't done any analysis on supplemental groundwater rights since that time, could those rights be not available today, not being used today, if they're in other programs?

A. Did you say enrolled in mitigation plans?

Q. Yes.

A. So the wells would still be in use?

Q. Maybe not. I don't know. That's the question.

A. It should be based on the wells that are -- I think that the wells that are actually in use.

Q. So do you know how long it takes the groundwater districts to compile their annual use of their members' groundwater rights?

A. I do not.

Q. One last question: Would the priority date of a supplemental groundwater right matter if it was subject to a curtailment order?

A. It might.

Q. I'd like to ask you a few final questions, I guess, looking at Exhibit 365.

Do you have that in front of you?
A. Yes.
Q. How many gauges did you query for these tables or graphs? I'll call them graphs.
A. Well, they're listed in the footnotes. I haven't counted them up.
Q. So the only ones that are totaled here are the ones actually listed --
A. Yes.
Q. -- in the notes?
A. Yes.
Q. How do you define the term "TFCC Return Flows" at the top?
A. I think that's the -- that's the sort of general terminology that's used -- that the Department has used. It's return flows coming off a tract, so it's measured water below that canal service area.
Q. So does it include water from other sources, not just irrigation return flow?
A. It could.
Q. So the orange tributary bars, are those natural streams?
A. Yes. So, I mean -- and as we heard Jay Barlogi talk -- testify earlier, there's -- some of their runoff off the waste or surface runoff goes into

tributaries.

Q. Certainly, during irrigation season that could be a component of that flow at that particular time?

A. Yes.

Q. How about runoff precipitation events?

A. It could be in high -- like it rained here last night.

Q. 3 inches, I think, at Crane Creek.

A. It was a lot. Almost as much as it rains down in Florida now, like that.

Q. Did you differentiate the irrigation return flows from other natural runoff in this graph?

A. I did.

Q. And it appears that some of these run year-round; is that correct?

A. Yes, there's some water in the winter.

Q. Are you aware of seeps in groundwater returns that might be included in these numbers?

A. Probably is some of that, yes.

MR. THOMPSON: That's all the questions I have.

HEARING OFFICER: Okay. Thank you, Mr. Thompson.

MR. THOMPSON: Oh, sorry. I've got a couple more.

HEARING OFFICER: Go ahead.

Q. (BY MR. THOMPSON) Getting back to your question on project efficiencies, would your proposed use of an efficiency regression with that 75th percentile, essentially, disfavor seniors?

A. No.

Q. How so?

A. Because it would be using the efficiency values that they have shown to be able to operate at.

Q. At certain times? Is that correct?

A. Yeah, but I think it's entirely reasonable to be -- I'm not picking the very top, I'm just picking within the upper part of the range that they've shown they can operate at.

Q. So do you agree that large canal companies would need some sort of base level to operate their diversion system?

A. What do you mean, "base level"?

Q. Can they simply follow the ET curve seasonally or annually crop --

A. Well, that's why -- well, I'm not sure if I understand your question. But that's why these efficiencies are not 100 percent, and there's allowances for losses and inefficiencies.

Q. So do you agree there's beneficial diversions

of water to bear crops that go beyond just meeting the consumptive irrigation requirement of the plan?

A. When you're, like, storing water and soil moisture for subsequent use, yes.

Q. How about canal charging?

A. Yep. And that's the reason that the efficiencies -- the conveyance efficiency can be temporarily higher in the spring. Although, I understand, you know, canals like Twin Falls and some others run year-round now because of the recharge.

So maybe some of that charging part is not as big a deal as it used to be.

Q. I guess, are you aware of the location of Murtaugh Lake compared to the rest of the project on Twin Falls Canal Company?

A. It's up near the top.

Q. How about having an available steady supply of water, if that's how they deliver?

A. Can you be more specific on what you mean?

Q. Yeah. Do you consider that a beneficial diversion of water that goes just beyond meeting the crop water need for the plan?

A. I think that's part of the reason Twin Falls is so inefficient is because they -- their operational practice is to basically guarantee a rate of water to

their users rather than an allotment system. It's more typically used by these large systems, and it leads to a less efficient operation.

It's great for the users, and it's great if you have enough water, but you can -- a system can be operated more efficiently under an allotment system. There's incentives for saving water.

Q. So which entities are you referring to that use an allotment system?

A. I know some of the Surface Water Coalition members do, but I just -- I haven't -- and that's something we looked at back -- way back when. I just didn't have a chance to refresh myself on that.

Q. How about diverting water for chemigation and soil tillage, is that a beneficial use of water?

COURT REPORTER: Okay. Wait. Can you repeat your question?

Q. (BY MR. THOMPSON) Using water for chemigation or soil tillage, is that a beneficial use of water?

A. It's a beneficial use. I think it, you know -- and I don't know how much of that is happening, how big of a deal that is. I mean, if they're -- yeah, I don't know. It's a beneficial use, though.

MR. THOMPSON: Thank you. That's all I have.

HEARING OFFICER: Thank you, Mr. Thompson.

Redirect?

MR. BUDGE: Director, the cross-examination by Mr. Fletcher and especially -- and partly by Mr. Thompson went way outside of what's in Mr. Sullivan's expert report and what was offered in direct, so I would like to also ask a few follow-up questions.

HEARING OFFICER: Well, I'm not sure that I agree with you, that it went way outside the boundaries of direct.

I disagree, but I don't object to your asking some questions. But before you do, Mr. Budge, and before you come all the way forward, I want to give Ms. Klahn an opportunity to ask questions.

MS. KLAHN: I'd rather go after Mr. Budge because I don't know what he's going to say, if that's okay, Mr. Director.

HEARING OFFICER: Well, let's stay as long as we have to.

Mr. Budge.

MR. BUDGE: I'll be as quick as I can.

MR. FLETCHER: 30 minutes; right?

///

CROSS-EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Thank you, Mr. Sullivan.

I want to follow up on some of the questions that were asked by Mr. Fletcher.

You'll recall there was a lot of questions about Colorado replacement water plans?

A. Yes.

Q. That is not something I am familiar with, but I assume they're governed by Colorado law?

A. Yes.

Q. And they're designed to accommodate Colorado water systems?

A. Yes.

Q. They're not governed by Idaho's conjunctive management rules?

A. No.

Q. And you're not advocating today that the Director replace the Fifth Methodology Order with --

COURT REPORTER: So, Mr. Budge, I'm going to need you to slow down, please.

MR. BUDGE: He's telling me to speed up.

COURT REPORTER: I can't get it, though.

HEARING OFFICER: No, I'm encouraging you to be more articulate.

MR. BUDGE: Touché.

MR. FLETCHER: More efficient and articulate.

Q. (BY MR. BUDGE) You're not advocating the Director replace the Fifth Methodology Order with a Colorado replacement water plan?

A. No.

Q. Let me ask you about a question Mr. Fletcher asked about some rulings by Judge Melanson related to the five-eighths-inch versus three-quarter-inch delivery for Twin Falls Canal Company.

Do you remember those questions?

A. Yes.

Q. Do you remember Mr. Fletcher asking if you knew that Judge Melanson had rejected or overruled the five-eights-inch standard?

A. Yes.

Q. And your response was that you'll take Mr. Fletcher's word for it?

A. Yes.

Q. So the record's clear, you don't know whether -- that Judge Melanson accepted five-eighths inch or three-quarters of an inch?

A. No.

Q. And to the extent that's in the record, that would reflect Mr. Fletcher's testimony and not your own?

A. Yes.
Q. Mr. Fletcher asked you if there had been any curtailment of groundwater rights to date, and I believe your answer to that was, to your knowledge, no?
A. This year?
Q. I think it was to date.
A. To date this year; right?
Q. Yes. Was your answer with respect to this year alone?
A. Yes.
Q. Okay. You weren't referring to curtailment in prior years?
A. No.
Q. There was a dialog between you and Mr. Fletcher about who should be curtailed when the seniors are short of water.
You said something to the effect that those who caused the problem should be curtailed; is that right?
A. Yes.
Q. You also testified that curtailment is extremely inefficient in the conjunctive management context?
A. Very.
Q. And it should be a matter of last resort?

A. Yes.
Q. And so it's fair to say that your testimony has been that curtailment should only be pursued to meet genuine water needs by the senior?
A. Well, not exactly. I mean mitigation should be provided to meet genuine water need, and curtailment, like I say, is a -- at last resort. If the user doesn't want to mitigate, then they shouldn't be allowed to pump.
Q. And in terms of calculating mitigation obligations, mitigation should only be required to the extent the senior actually needs it to grow crops?
A. Yes.
Q. And did I understand your testimony that the Fifth Methodology Order has created no incentive for seniors to become more efficient in their water use?
A. That's correct.
Q. In fact, if I understood your testimony earlier, there's some incentive built into the methodology that encourages the seniors to divert more water than may be required for their crops?
A. Yes. There's this feedback loop that the more they divert, the more they're entitled to under the methodology.
Q. And then, lastly, there was some discussion

about prior court rulings involving reasonable use of water. And I think Mr. Fletcher represented that a prior decision found Twin Falls Canal's diversions to be reasonable.

Do you remember that?

A. Yes.

Q. Do you recall whether that decision was based on efficiency or just based on whether Twin Falls was wasting water?

A. I don't recall.

Q. And efficiency is a spectrum. You can be highly efficient or --

A. Absolutely.

Q. -- poorly efficient?

And the waste threshold, as you understand that, would be at the very bottom end of the spectrum?

A. Well, my understanding is that it's -- they're really two sides to the same coin, the way that it's evolved and put out in the conjunctive management rules and the decisions that are being made.

If you're operating with reasonable efficiency, you're not wasting, and if you're wasting, then you're not operating with reasonable efficiency.

I used to think there was, like, some multiple tiers, but I don't think that anymore.

Q. Does your analysis show that since 2008 when the Methodology Order was first developed and we last had an evidentiary hearing, that Twin Falls Canal Company and other members of the Surface Water Coalition are not demonstrating increased efficiency even though you would expect that given the improvements made to the canal system?

A. Yes, that's correct.

MR. BUDGE: That's all I've got. Thank you.

HEARING OFFICER: Mr. Budge, I want to compliment you on your articulate questioning of the witness.

MR. BUDGE: It's about time.

MS. KLAHN: It was a lot less than ten minutes, TJ.

HEARING OFFICER: I did not mean it as a personal shot at you, so please accept my apology.

I also want to observe in the -- as I scanned the document and as I listened to the testimony, that the expert report is replete with references that say "in Colorado" and "in Colorado" and "in Colorado," as well as the testimony. I'll just observe that I think there's a lot of reference there, but I won't draw any more conclusions than that.

So, Ms. Klahn, from Colorado, you may question

the witness from Colorado.

THE WITNESS: I'm not in Colorado anymore.

MS. KLAHN: He's from Florida now.

HEARING OFFICER: Florida now, huh?

MR. FLETCHER: I can't wait to hear what they do in Florida.

HEARING OFFICER: Following the water problems.

MR. FLETCHER: The drain ditch problems.

MS. KLAHN: You should see the returns flows down there.

HEARING OFFICER: Ms. Klahn?

MS. KLAHN: Thank you.

REDIRECT EXAMINATION

QUESTIONS BY MS. KLAHN:

Q. Just a couple of things.

The discussion you had with Mr. Fletcher about the project efficiency aspects of crop water need, do you recall that?

A. Yeah.

Q. And I feel like there might have been some confusion about what the Methodology Order calculates and what's shown in Figures 3-1, et cetera, versus what your conclusions are.

Could we take a look at that real quick?

A. Sure. 3-1?

Q. Yeah. So in Figure 3-1, just to make sure the testimony is clear, you included on that figure your -- I don't remember what the terminology is because I didn't bring the report up with me -- the efficiency number you calculated in 2007; is that right?

A. Yeah, the seasonal efficiency. That's the blue lines.

Q. Right. And that was for purposes of comparison with the actual efficiencies that the Surface Water Coalition is currently experiencing; is that right?

A. That's one of the purposes, yes.

Q. Okay. There was a question about the -- whether chemigation and soil tillage were beneficial uses; do you recall that?

A. Yes.

Q. Would you agree that chemigation and soil tillage are not part of the crop water need?

A. I don't know.

MS. KLAHN: And I think those are all the questions I have, Mr. Director. Thank you.

HEARING OFFICER: Thank you for being succinct.

Recross?

Recross, Mr. Fletcher?

MR. FLETCHER: No, I don't have any.

HEARING OFFICER: Mr. Thompson?

MR. THOMPSON: No. Thank you.

HEARING OFFICER: Okay. Are we finished with Mr. Sullivan?

MS. KLAHN: I think so.

HEARING OFFICER: It sounds like we are.

Okay. It's 5:00 o'clock. The timing of examination of counsel is admirable.

Do we want to call the next witness? I assume not?

So looking at the schedule, I assume that Sophia Sigstedt will be scheduled tomorrow morning to testify, is that right, Ms. Klahn?

MS. PATTERSON: That's correct.

HEARING OFFICER: Oh, wait a minute.

TJ?

MR. BUDGE: That's correct.

HEARING OFFICER: Do you want to start at 9:00, everyone? Are we on schedule to finish on Friday, looking at the witness list?

MS. PATTERSON: I think we are, Director. We are only going to call one late witness, Mr. Carlquist.

And then I believe we just have a witness from Amalgamated, a witness from McCain, and then your expert witnesses.

I think that we can get Ms. Sigstedt and Mr. Contor done by midday tomorrow, leaving time in the afternoon for rubuttal.

MR. BUDGE: That's only if they'll be as succinct as I am.

MS. KLAHN: No, you're not succinct, I'm succinct.

HEARING OFFICER: And articulate.

MR. JOHNS: I can't make any promises about midday.

MR. FLETCHER: You're articulate, she's succinct.

HEARING OFFICER: Let's go off the record because we're devolving downward, I think. So let's go off the record.

So we'll adjourn until tomorrow at 9:00 a.m.

(Hearing adjourned at 5:03 p.m.)

REPORTER'S CERTIFICATE

I, ANDREA L. CHECK, CSR No. 748, Certified Shorthand Reporter, certify;

That the foregoing proceedings were taken before me at the time and place therein set forth, at which time the witness was put under oath;

That the testimony and all objections made were recorded stenographically by me and transcribed by me or under my direction;

That the foregoing is a true and correct record of all testimony given, to the best of my ability;

I further certify that I am not a relative or employee of any attorney or party, nor am I financially interested in the action.

IN WITNESS WHEREOF, I set my hand and seal this 19th day of June, 2023.

P R O C E E D I N G S

HEARING OFFICER: Okay. It's 9:00 a.m. June 8th, and we're ready to start.

Are we on the record, Andrea?

COURT REPORTER: Yes.

HEARING OFFICER: Microphones are on.

Sarah, can you hear us?

Sarah is there, her image is there, anyways. Maybe she just logged in.

Okay. Do we have Candice McHugh today?

MS. KLAHN: She will join us later. She's at a meeting with one of her clients getting ready for the testimony tomorrow.

HEARING OFFICER: All right, good. Are there any preliminary matters that need to be addressed this morning? If not, I think the witness that's --

MR. WOOD: Should we see if these guys can hear us?

HEARING OFFICER: Yeah. Is Garrick Baxter on?

MR. BAXTER: I'm here, Director.

HEARING OFFICER: You can hear us?

MR. BAXTER: Yes, we can hear you fine.

HEARING OFFICER: Great. All right. Thanks.

I think the next witness is Sophia Sigstedt;

is that correct?

MS. PATTERSON: That is correct, Director.

HEARING OFFICER: And who will be examining?

MS. PATTERSON: Elisheva Patterson on behalf of IGWA will be.

HEARING OFFICER: Good. Ms. Patterson, if you will come forward, please, and find one of the microphones.

And, Sophia, I see that you are online and participating remotely.

THE WITNESS: Yes, thank you.

HEARING OFFICER: So I hope this examination can proceed in a way that's meaningful.

Okay. I guess I need to swear you in from a distance, Sophia, so if you'll raise your right hand.

SOPHIA SIGSTEDT, PH-GW,

called by IGWA having been first duly sworn to tell the truth relating to said cause, testified remotely as follows:

HEARING OFFICER: Thank you.

All right. Ms. Patterson.

MS. PATTERSON: Thank you, Director.

///

DIRECT EXAMINATION

QUESTIONS BY MS. PATTERSON:

Q. Good morning, Ms. Sigstedt. May I call you "Sophia" today?

A. Yes, that's fine.

Q. Thank you.

Can you please give the court your name and your business address.

A. Oh, gosh. Yes, my name is Sophia Sigstedt. And the business address is -- sorry, just give me a second.

Q. Just the business is fine.

A. Okay. Lynker in Boulder, Colorado.

Q. Thank you.

And, quickly, can you tell me what your educational background is.

A. Yes. I have a bachelor's degree in environmental science from the New Mexico Institute of Mining and Technology and a master's degree in hydrology, also from New Mexico Institute of Mining and Technology.

Q. And how long have you been with Lynker?

A. I've been with Lynker since 2015, so about eight years. But I've been consulting since 2010, so a little over ten years.

Q. And how long have you been familiar with the -- this project, the Eastern Snake Plain Aquifer?

A. I started working for IGWA around 2012, 2013, so about ten years I've been working on the Eastern Snake Plain Aquifer.

Q. And what type of work do you do for IGWA?

A. I started with IGWA during the Rangen litigation. So I did a lot of modeling, water right support related to that matter. I've done some witness testimony also related to water right transfer in a mitigation matter for the Rangen case. I've done a lot of groundwater modeling, looking at IGWA's various mitigation activities around CREP, recharge, water conservation, modeling those activities as part of a mitigation plan. I've done modeling for settlement agreements around water conservation. For IGWA, I participate on a number of technical working groups like the --

Q. Yes, thank you.

So you've worked since 2012 -- was that the date? -- 2012, 2013 on -- with IGWA?

A. Yes, that's right.

Q. So you're familiar with this project?

A. Yes.

Q. You mentioned briefly that you work on

other -- or not other consulting projects -- strike that, please.

Can you tell me about the other committees that you mentioned. Is there an aquifer modeling committee that you are on and participate on?

A. Yes. So I'm a member of the Eastern Snake Plain Hydrologic Modeling Committee, which does technical advisory and oversight of Eastern Snake Plain hydrologic model or ESPAM. I also participate in the Big Lost Modeling Technical Advisory Committee.

Q. Okay. Thank you. I'm going to move to what you did on this case.

What were you asked to do here in preparation for this hearing?

A. I was asked to review the Fifth Methodology Order, the April As-Applied Order, and the various expert reports that were submitted in this matter.

Q. Thank you.

As a part of this hearing, did you also participate in technical working groups held by the Department staff in 2022?

A. Yes. I was part of the -- all of the meetings for the 2022 technical working group, and I was also part of the 2015 technical working group in this matter.

Q. Thank you.

And did you submit comments to the Department on each of the 2015 technical working group and the 2022 technical working group?

A. Yes, I did.

Q. Did you submit an expert report in this case?

A. Yes, I did.

Q. And we have identified that as Exhibit 837.

Do you have a copy of that with you?

A. I do.

Q. Wonderful. So we will be going over your expert report today.

We have also discussed your written comments that you made to the staff in 2015. Those are identified as Exhibit 103. We will be referring to those during your testimony today.

And then your 2022 comments are identified as Exhibit 916.

A. I have all of those.

Q. And you have copies of those available to you?

A. Yes.

Q. Thank you.

On this expert report and on your analysis of the Fifth Methodology Order and the As-Applied Order, were you able to perform all of the work you wanted to do?

A. No, there is a number of things that -- sort of outlined throughout the report that I didn't have time to accomplish. And I think I submitted some other documents to the court related to kind of further analysis around irrigated acres. I would have liked to have done some modeling to evaluate As-Applied Order models that's detailed in the report. I think reasonable carryover is something that I didn't have very much time to analyze in this report; that's something that I would have liked to have spent more time on. Project efficiencies --

Q. It's kind of hard for you to see me, but I'll try to interrupt you if -- we will address, you know, these matters in more detail as we go through your report, but suffice it to say there were more things that you would have liked to do if you had time in assessing the Fifth Methodology Order and the As-Applied Order?

A. Yes. There are a huge number of components to this methodology, and that was a very compressed time frame to put together this report and analysis.

Q. Okay. Thank you.

And were there other matters that IGWA had asked you to work on that, you know, this analysis pulled you off of?

A. Yes. We're doing -- I'm doing some workaround looking at how -- approaches to a groundwater management plan, I'm working on recharge analysis, several things that could have been done -- that should have been done in this time.

Q. Okay. Thank you.

Let's turn to your report now and discuss what you mentioned, the irrigated acreage issue. And can we look at Table 2-1, which is a summary of the SWC irrigated acres 2015, TWG.

A. Okay.

HEARING OFFICER: So, Ms. Patterson, this is Exhibit 837 in the common exhibits?

MS. PATTERSON: This would be under IGWA's exhibits.

MR. WOOD: What number again?

MS. PATTERSON: 837. It should be the last binder.

MR. WOOD: 837?

MR. BUDGE: Director, can we go off the record just for a moment just to address a logistical matter?

HEARING OFFICER: Yes.

(Break taken.)

HEARING OFFICER: Back on the record. We're recording again. Microphones are on.

Ms. Patterson?

MS. PATTERSON: Thank you.

Q. (BY MS. PATTERSON) Sophia, can you see me a little better now?

A. Yes, thank you.

Q. So I previously asked you to turn to your report, which is Exhibit 837, and then on page 8, there is a Table 2-1.

Can you please tell us again what the 2015 TWG refers to?

A. Yes. So in 2015, I think, there was an order that directed Department staff to convene a technical working group around a number of issues. One of the issues that was discussed was improvement to the reasonable in-season demand. And part of that was looking at irrigated acres.

This table that you're referring to is basically a summary of irrigated acres presented to the technical working group related to their reasonable in-season demand calculation.

Q. Okay. And then in your report, two paragraphs above the second sentence, it reads: "It was my understanding that in 2015 that these would be the irrigated acres used in the Methodology Order. However, my recent review of the Department's RISD calculation

spreadsheet indicates that these acres were only applied to calculations 2000 to 2014."

Can you explain that comment for us?

A. So I'm referring to the very last column in the Table 2.1 that you referred to that's labeled, and this is the Department staff's labeling, "2013 Reasonable In-Season Demand." So in that column, there's sort of a conglomeration of the different irrigated acres presented in the table where they're either taking what's from the partial decree irrigated acres, or it seems like they're using the 2005-2007 SPF acres, which I think have been mentioned in testimony represented in previous proceedings.

And so it was my understanding that the last -- the acres in that last column were being used in the reasonable in-season demand. They provided a spreadsheet of the reasonable in-season demand calculation in 2015, and these were the irrigated acres used in the calculation sheet at that time.

When I referred to they were only used through 2014 is that for this proceeding, we were given an updated spreadsheet, something like that reasonable in-season demand through 2022, and that includes a hindcast, basically, from -- you know, the order wasn't implemented until I think 2010, but that includes a

hindcast of reasonable in-season calculations starting in 2000. And what I see in that sheet was that these irrigated acres in this column were used in the reasonable in-season demand from 2000 to 2014.

Q. So you identified some of the columns here. Am I to understand the 2013 RISD column of -- those were used in the hindcast, which means that they were used in the As-Applied Order to calculate RISD in 2000 to 2014?

A. Like I said, I think the As-Applied Order really only goes through 2010, but, yes, I think these were the irrigated acres used in the calculation during that time.

Q. Okay. And then you mentioned, you know, that second column from the right, "2005-2007 SPF."

Do I understand -- is that the Spronk engineering inputs?

A. Yes.

Q. And so, for example, Burley, it looks like that's 44,715, and then in column -- on the far left, that same number is used for the 2013 RISD?

A. Correct.

Q. And similar for Minidoka and Twin Falls Canal Company?

A. That's correct.

Q. Thank you.

Let's move next to Table 2-2, which is on page 9. Can you explain to me what this is?

A. Yes. So this is the table extracted directly out of the reasonable in-season demand calculation sheet. You can see this in both the version provided to the technical working group dated 2014, and you can see this same table in the reasonable in-season demand calculation sheet provided to the technical working group in 2022 -- or it was -- yeah, 2022.

And, essentially, you can see that this is -- these are the data cells used for irrigated acres in the reasonable in-season demand calculation, like I said, 2000 through 2014.

Q. And what is significant about the Twin Falls Canal Company acreage?

A. So you can see, like the table that we referred to previously, they're implementing the SPF, the Spronk water irrigated acre numbers there. They're referencing an exhibit I think that was used in the proceeding to, basically, accept these acres to be used in the reasonable in-season demand calculation.

Q. Thank you.

Did the Department staff tell the 2015 technical working group that they were planning to change the acreage that was used to calculate RISD that

was shown in Table 2-1?

A. I don't recall that, and I went through the staff recommendations which were very detailed in terms of what they were recommending to change, and there was nothing about changing the number of irrigated acres that they were going to be applying in the reasonable in-season demand calculation.

Q. Thank you.

Let's go to that memo, which is actually an attachment to your report, but it is also Exhibit 103. If we want to stay on the report, we can just look at page 50.

Sophia, do you have in front of you that staff report that is from Liz Cresto and Matt Anders to Gary Spackman dated March 16th, 2015?

A. I do.

Q. And do you recognize this?

A. Yes.

Q. Can you explain to me what this is?

A. Yeah. So I think at the conclusion of the series of technical working group meetings in 2015, the staff was, basically, describing the recommendations that they were going to have if they were recommending to have implemented in the methodology. And then they also describe, I think, pieces of improvements to

reasonable in-season demand and others that they didn't have time to, basically, do analysis and address to make a recommendation on.

Q. Thank you. And then if we turn to page 55 of your report, which, again, is -- we're still looking at that memo from Liz Cresto. It says down at the bottom that -- the last paragraph summarizes the work on the mid-season forecast demand.

It reads: "With the limited time frame the committee was given, we were unable to conclude an analysis of methods to improve RISD forecasts. Because this analysis was not yet complete, we cannot currently recommend changes to the current methodology regarding this issue."

Do you recall why there was a limited time frame?

A. I do not, but I definitely do remember the staff talking about being under a compressed time frame during the period that they had to do the analysis.

Q. Do you know whether the technical working group or Department staff has completed this analysis since 2015?

A. I think the things that she lays out here and that I recall from the presentations to the technical working group were, she was looking at alternative

possibilities for basically forecasting the remainder of the irrigation season and the reasonable in-season demand calculation, so opposes the current methodology that uses the baseline year to come up with volumes for the months that haven't occurred. She was also looking at supplemental groundwater use and reevaluating the project efficiency methods.

To my knowledge, none of that analysis was carried on past this point or further.

Q. Thank you.

If you go down to page 56, I believe that's where supplemental groundwater use is discussed, so under Section 4, paragraph 2, sub (b), it says: "Supplemental groundwater use. There was insufficient time for the committee to evaluate this subject."

Does that match what you recall?

A. Yes.

HEARING OFFICER: Ms. Sigstedt, could you tell me which exhibit that you are referring to at the present time?

THE WITNESS: I'm looking at the last page of the 2015 Department staff recommendations.

HEARING OFFICER: So, Ms. Patterson, I'm sorry, that would be 103?

MS. PATTERSON: So it is contained in 103. If

you want to refer to it there, it would be the last page of that one. But it is also an attachment to Ms. Sigstedt's expert report. And if you're looking at the expert report, which is 837, it will be on page 56.

HEARING OFFICER: Okay. I now am on page 56 of Exhibit 837. Okay. Thank you.

MR. WOOD: I don't think that's correct.

MR. FLETCHER: It says: "Future committee meetings."

HEARING OFFICER: Yeah, it's titled, "Future Committee Meetings," Section 4.

MR. WOOD: Oh, that's right.

MS. PATTERSON: Yeah, that's right.

MR. WOOD: Okay. That's fine. Sorry.

HEARING OFFICER: Go ahead.

MS. PATTERSON: Sorry, there's a lot of paper.

MR. WOOD: Yeah.

Q. (BY MS. PATTERSON) Sorry, I'll just go back.

So as you recognized or just testified about before, the technical working group in 2015 did not have time to address the supplemental groundwater use, and is that reflected in the report on page 56?

A. That's right. And you can see right above that, the Department staff is also recommending that they would have liked to continue this work in future

meetings. I think they recommend something like one meeting a year or something. And that -- that has not taken place. I don't think that recommendation was taken up.

Q. Thank you.

Section D also identifies future work. Irrigated acres, it says: "Significant discussion focused on this topic. And it was generally agreed that the processing for determining irrigated acres for SWC members could not be improved."

Do you recall that discussion?

A. Yes. I think discussion around irrigated acres was -- had to do with the submittals by the Surface Water Coalition, whether they were updated and whether the Department had a process in place to, basically, evaluate what the Surface Water Coalition submitted.

Q. Thank you.

Let's move on to page 66 of your report, which are your comments in 2015 in response to the Liz Cresto report.

Is that correct?

A. I'm sorry, I have a different page number. Okay.

Q. So can you just describe this document?

HEARING OFFICER: So what document are we looking at now?

MS. PATTERSON: If you stay on the current exhibit that you are on, 837, and if you go to page 66.

HEARING OFFICER: Okay.

THE WITNESS: So following the recommendation comments from Department staff in 2015, they gave an opportunity to the technical working group members to provide their own comments that would be attached to their comments, which is what you see. These are my comments related to what they recommended.

Q. (BY MS. PATTERSON) And just so we're clear that we're all looking at the same document, is this the one dated March 16th, 2015?

A. That's what I'm looking at.

Q. Perfect. Okay. On page 68, the last two paragraphs refer to "irrigated acres."

Are these comments referred to in your current report?

A. Yes.

Q. Can you explain to the Court what your comments are here?

A. So what we heard from the technical working group on irrigated acres was that there was not a process in place for the Department to basically

evaluate a submittal, aside from overlapping -- removing overlapping acres, I think, from those shapefiles.

So my comments here have to do with recommending that they're -- they do put in a review process around irrigated acres submitted that includes identifying hardened acres using either aerial imagery or remote sensing data, which was presented as being available to the Department to use for this type of analysis.

So I lay out kind of the things that they should -- a process around things that should be removed, like roads and surfaces, things like that. And then I also have a comment here that I, essentially, disagree with using the 5 percent standard as the Surface Water Coalition's being able to, essentially, say that as long as they haven't changed their acreage within 5 percent -- this has to do with something we heard, I think in testimony earlier -- that for a very large irrigation district like Twin Falls Canal Company, 5 percent of that irrigated acres can be something like 10,000 acres and that can, you know, add up to some tens of thousands of acre-feet in terms of crop water need.

Q. Potentially erroneous crop water need?

A. Exactly. An erroneous calculation of crop water need that would fall into the demand shortfall

calculation.

Q. Do you know if the Department has done anything to improve the process?

A. No. I think based on the information that we represented in the 2022 technical working group, not only have they not implemented their own review process, for whatever reason, it seems like they have reverted back to using more outdated irrigated acres than were presented to us in this 2015 technical working group, which took into account, basically, the nonirrigated acres that had previously been identified and presented to the Court for various irrigation entities.

Q. Okay. Thank you.

Let's go back to the body of your report. So we're still on Exhibit 837, but we'll be going to page 10. And we're looking at Table 2-3, Summary of SWC Irrigated Acres 2022, TWG.

Can you just explain again what the 2022 TWG is?

A. So again, by order, the Department staff were directed to convene a technical working group. This is the first one since that 2015 technical working group. There was a series of meetings held as part of meetings around looking at the implementation of what's called near real-time METRIC data, and they presented

information on irrigated acres.

This table is a summary of the various datasets for irrigated acres that were presented to the technical working group committee in 2022.

Q. Okay. So this came from a presentation that was given by the Department in the 2022 technical working group?

A. Correct.

Q. Thank you. So what does this show, this table?

A. So this shows -- it starts with a column called "Shapefile Acres." These are either from the permitted place of use, PPU, with a date; acres recorded; or sometimes there's a shapefile that has been submitted by Surface Water Coalition following that date, so it has -- that would be designated by SWC with the date that that shapefile was committed and the associated acres. That's the first column.

The second column, and these are the Department's labeling, is "If Removed Non-irrigated Acres Using the 2011 Irrigated Lands Dataset." So these report the acres for the districts from using the Departments irrigated land dataset.

The same thing is in the next column but is the updated irrigated lands for 2017.

And then, like I said, this presentation, I think, was focused around the implementation of near real-time METRIC, and so they have a column labeled "Near Real-Time METRIC Processing Acres" that was done in 2021.

And then the last column is, essentially, the acres that are used in the Methodology Order. And like I said, I reviewed the reasonable in-season demand calculation sheet for the Methodology Order and following -- starting in 2015, the very last column here, are the acres used in every year for the reasonable in-season demand calculation.

Q. Thank you. If we go to page 11 of your report, the first paragraph has a sentence that reads: "Every technical analysis of the irrigated acres consistently shows that Twin Falls Canal Company is irrigated approximately 15,000 acres less than the" 19 -- or "194,732 acre figure that Twin Falls Canal Company reports to IDWR as being irrigated."

And then there's references to the SPF report from 2008 and the IDWR irrigated lands dataset in 2011 and 2017, and then the NRT METRIC data for 2021.

Can you explain to me, you know, how those different references helped you form that conclusion?

A. I mean, you can see it in the table we were

just referring to, Table 2-3. Each of those datasets that is -- has, basically, an actual analysis. What the irrigated lands, the actual irrigated lands are at that time shows that it's about 15,000 acre-feet less than the irrigated acres that's being used for Twin Falls.

You know, this is confusing, because I think in the same presentation, Matt Anders makes very clear that in the Department methodology nonirrigated acres are not supposed to be included in the reasonable in-season demand calculation, and, essentially, they're showing consistently data that shows that those nonirrigated acres are being used.

Q. Thank you. Can you explain to us the IDWR irrigated lands dataset, as you understand it?

A. Yes. As I understand it, this was something that was, I think, originally commissioned for Eastern Snake Plain Hydrologic -- or at the direction, maybe, at the Eastern Snake Plain Hydrologic Modeling Committee. They used this dataset in the calibration of the model, and the year that it is available, they use that as the irrigated acres, then they apply whatever method they're using to calculate ET, or evapotranspiration, to come up with a consumptive use volume associated with those acres to be used in the model and the model calibration.

Q. So just to confirm, this irrigated lands

dataset, this was used in the model?

A. Correct. It's -- yep -- whatever years it's available, it's used for those years until -- starting in that year until the next most updated irrigated lands dataset comes available.

And I think I list in my report there, I saw, basically, some Department information, like a story map or something, talking about these irrigated lands dataset, and it looks like starting in, basically, 2008, they've developed it for every year through 2017.

Q. Thank you.

On page 12, there's a figure labeled "2-1." Can you explain this figure just briefly?

A. So this comes from a 2006 document about how the irrigated lands dataset is created. I found this in background material presented to the technical working group in 2015, so I think it was made available to us then in terms of understanding how the irrigated lands dataset worked.

And, essentially, what you can see is they start with remote sensing data of irrigated lands, which is kind of the green box without any delineation s, and they overlay that with a very detailed -- the most detailed polygon area that they can find. It's called the CLU, and it's, basically, designed to be the

smallest boundary that they can. So individual fields owned by individual owners, just, basically, the most discretized polygon acres that they can associate with the various land designations.

COURT REPORTER: Ms. Sigstedt, hold on because I missed a word.

(Record read by reporter.)

THE WITNESS: I think "discretized" is the word I used.

COURT REPORTER: Okay. Thank you.

THE WITNESS: So they use the -- they use the Landsat image to then assign those polygons as either irrigated or nonirrigated. And then they take that classification, and they mask it with, basically, aerial imagery to identify where the developed acres are.

And we heard testimony earlier that this -- the IDWR irrigated lands dataset is basically classified into three classes that includes irrigated, semi-irrigated, and nonirrigated. And so they use the aerial imagery to identify the semi-irrigated acres, which in -- ultimately, this all resulted in the last image that you see on the bottom right where the irrigated acres are shown in green, the semi-irrigated acres are shown in gray, and the nonirrigated acres are shown in tan.

Q. (BY MS. PATTERSON) Thank you.

And you said that this dataset is available -- or has been used by the Department since 2008 through present, or they at least have the dataset.

Can you clarify what that comment was?

A. I think they started this dataset around 2006 -- I'm not sure exactly when they started -- and they did some prior years like, maybe, 1986, 1996, 2000 [sic]. But my comment was that, at least based on the information -- I haven't checked the archived data to verify this, but based on information from the Department, it looked like starting in 2008 this dataset is available every year through 2017.

And they continually update it every year for the model. Like right now, they're estimating that the 2021 dataset will come out next year, I think. And it just takes them a while to process. It's a very detailed dataset that is well done, and so it takes them a while to process it.

Q. Thank you. The next section of your report discusses IDWR METRIC dataset.

Can you explain your understanding of this?

A. Yes. So, also, I think for the ESPAM model development, they started working with -- I think the University of Idaho, basically, under a grant to come up

with an alternative method to using the ET data just measured at point sources from weather stations to coming up with mapped evapotranspiration data across the entire Snake Plain that they could use for their consumptive use in the model. And so, again, they went back for -- they have some years like 1986, 1996, 2006, but they started developing, as often as they could, a METRIC dataset to be used in the model for ET.

Q. Thank you.

And so Figure 2-2, on page 13, is that an example of the METRIC ET?

A. Yes. So here, you can see the model boundary on the left figure, and then the -- where that METRIC data covers in terms of just the images that come out from the METRIC analysis. And then there's kind of a zoomed-in picture to show you how detailed this METRIC is in terms of they can apply it on a field-by-field basis for coming up with an evapotranspiration rate.

Q. Thank you.

And then on page 13, you have a section on your conclusions. Can you just briefly explain your conclusions based off of all these different technical working groups and the work that you've done?

A. Yeah. So I think based on the information that I understand that the Department has available to

them, they certainly have the capability to be updating the irrigated lands that are used in the methodology to be consistent with only applying nonirrigated -- or to not apply nonirrigated acres and to only be using irrigated acres. I think that the -- whatever is the most up-to-date IDWR Landsat at a minimum should be used to evaluate what the shapefiles that the Surface Water Coalition submits in terms of irrigated acres.

I understand from the Department staff testimony that they would like that to be available every single year. I think that there are a number of components in the methodology that aren't available in real time, the crop links which is also used in the reasonable in-season demand isn't, and so I think using whatever is the most up-to-date dataset makes sense.

I think if they wanted to have the most real-time picture, it seems like they should be able to use the METRIC information that is -- potentially is available to them in-season, and they could use that to identify within the information that they already have what is being irrigated and what is not being irrigated.

Q. Okay. Thank you. Let's move on to another component of the reasonable in-season demand.

Can you talk about the baseline year and what the selection criteria are, briefly.

A. Yes. So the baseline years is, essentially, come up with a forecasted demand for the Surface Water Coalition entities that can be used in April before the season starts. It's meant to sort of balance -- be a balance between providing adequate protection for the senior surface water users without creating unnecessary -- you know, creating a level of protection against unnecessary curtailment of the juniors. There is a series of baseline criteria, and these are meant to account for three factors that are basically climate, water supply, and the irrigation practice.

Q. And are there specific criteria, like within the climate factor, for example, that the Department considers?

A. Yes. So I think in my expert report, I show the specific criteria being used for the baseline year, and, essentially, to capture irrigation practices, they only consider years post 2000 to make sure that current irrigation practices are only considered in the averages.

In terms of water demand or, you know, also related to irrigation practices, they look at what the total Surface Water Coalition diversions are. They also look at what the supply is in terms of the highest natural flow and then the storage allocations.

For the climate component, they look at what the evapotranspiration is. They look at what the growing degree days are, so, essentially, making sure that they're evaluating a long season. And they look at what the precipitation would be for the irrigation season.

Q. And then in your report, you have Figures 2-3 to 2-7.

Are these figures pulled from the methodology report?

A. That's right. And these figures show all of those individual baseline criteria components, and then they show what the average over the period is for these components so that you can see that for the -- so that you can see that they're meeting the baseline criteria in terms of whether they're supposed to be above or below average.

Q. Going to page 17 of your report. Can you explain how the baseline year has evolved over the different methodology orders?

A. Sure. So by my review, it seems like the First Methodology Order laid out the first baseline year to be used, and they, essentially, were using a period of record from 2000 to 2008. Based on the selection criteria, there's a statement in there that says, "'from

a standpoint of total annual SWC diversions, 2006 is an appropriate baseline year with 97 percent of 2000 to 2008 total surface water diversions.'"

That's a direct quote from the First Methodology Order, but the Director found that it would also be appropriate to use the values of 2006 and 2008, so an average of those values, to arrive at the baseline year. And the reasoning there was that it more strongly fits the criteria for all of the members. And in the '06 and '08 the average amounts to 100 percent of the Surface Water Coalition's diversions over that period of time.

If we move on to the Third Amended Final Order, which was the next update to the baseline year, the period of record that they're considering is 2000 to 2014. And the reason they needed to update the baseline year was that the previous average being used no longer met the baseline year criteria.

In that year, they had -- they considered 2012 as the baseline year. They decided that they did not think that was an appropriate baseline year because it was very extreme in terms of the average over some of the baseline year criteria. Ultimately, they chose the average, '06, '08, '12 for the baseline year criteria to establish the baseline year in that methodology. That's

101 percent of the total Surface Water Coalition diversions.

And then for the Fifth Methodology, which is the next update to the baseline year, they again had an extended period of record. So they're looking at 2000 to 2021 to evaluate those baseline year criterias.

The Department considered using 2018 or 2020 based on the review -- based on the information presented to us in the 2022 technical working group committee. They selected 2018 as the baseline year, and that's 104 percent of the Surface Water Coalition total diversion entities.

And I guess one thing that I note in terms of how this evolution played out, is that I think the difference between 104 percent and 1 percent of the baseline year, in terms of the bias it creates, is, essentially, looking at the difference between 32,000 acre-feet or 120,000 acre-feet, respectively, in terms of protection for the senior surface water user in terms of just sort of starting with how much demand you want to start with in the evaluation.

And I think that that's a significant shift from the previous baseline years that were all around that 100 to 101 percent. And I think it's informative that in the Third Methodology Order when they chose '06,

'12, '08 as the baseline year at 101 percent, they could have chosen -- I'm just looking for it here in my notes.

Q. I think it was the '08-'12 average?

A. Yes. They could have chosen the '08-'12 average, which would have -- instead of being 101 percent of the surface water diversions at that time, that would have been 104 percent of the diversions at this time -- at that time. And they chose not to do that. I think they chose a year closer to the 100 percent. They chose the 101 percent.

And I think that's because there's no need to shift the baseline year to that higher percentage because it's the accumulation of all the baseline year criteria, themselves, that ensures that there's above-average supply so that they can divert as much as they want. It ensures that it's a hot and very long growing season and in terms that there's minimal precipitation. And then on top of that, in terms of the demand shortfall, you already have a reduced forecast supply based on conservatism that they had in that.

So all of that, arguably, amounts to, you know, a very protective year in terms of what the senior needs to balance out protection for them versus curtailment of the junior.

Q. Thank you.

And just to summarize a couple of points, the Department allowed averaging to create kind of a synthetic baseline year in the past; is that correct?

A. Yes. In all of the previous orders, an average was used to, basically, get as close as they could to that 100 percent.

Q. Okay. Thank you.

Let's go now to your conclusions, which, you know, if you've already kind of testified about some of your conclusions, just please address on page 18 of your report if there's anything else that you kind of concluded from your analysis on the baseline year.

A. Yeah. So I think, you know, one thing you can look at, Twin Falls in particular, and look at choosing 2018 as the baseline year, which has 106 percent of the average Twin Falls, TFC, diversions, and that creates a bias in their favor of starting with 60,000 acre-feet. So that's almost the entire demand shortfall that was calculated this year. And I think if you take into account in addition what the methodology does to reduce the supply, what we can see in a year like this is that the entire demand shortfall is really based on just the conservatism in this methodology.

So I think it's important that that conservatism be balanced in some way when we talk about

60,000 acre-feet of shortfall being just the conservatism, and we think about the new method of the methodology, where the transient model is employed, we're talking about already a very senior curtailment date.

If we consider the curve that Jennifer Sukow presented in terms of looking at demand shortfall under the transient simulation and the -- what it generates for shortfall under the transient simulation, a 60,000 acre-foot demand shortfall basically starts you in around a 1961 curtailment date with over 500,000 acre-feet of groundwater curtailed. And so I don't really see the balance there for protection against curtailment for the junior.

Q. I want to direct you to page 20 of your report. Up at the top of that first paragraph, you state: "There were unique hydrologic circumstances in 2018 that I don't believe represent the typical dry year."

Can you explain that a little bit?

A. So in addition to just shifting the total demand for the Surface Water Coalition, the thing they're pointing -- when you look at 2018, I think there was a particularly good water supply outlook for that year, and there was a lot of recharge done across the

Eastern Snake Plain Aquifer in that year. And it also may have just lapsed water operations because the water supply was predicted to be so good, and it didn't need to be constrained.

And so a couple of things that I looked into was whether all the recharge water was accounted for in 2018. And I don't know if we're going to get into this, it might be later in my report, but what I see is that I don't think that they have -- that the Department's water allocation has accounted for all the recharge that needed to be subtracted out of 2018 as a baseline year.

And then the other concern I have with 2018 as a baseline year is if we look at the figures for the baseline year criteria, what we see is that it's particularly low in terms of the irrigation season precipitation. It's the only year in the entire record that doesn't have any July and September precipitation, and its total precipitation is, basically, at one standard deviation away from the average.

And when I look at previous orders on selecting the baseline year, it seems like they're choosing an average to get all of those baseline criteria closer to average so that, you know, an outlier-type year is not included as a baseline on its own.

Q. Thank you.

And are some of those things you just described, you know, about precipitation, are those identified in Table 2-4 on page 19?

A. No -- well, yes. Yeah. You can see in Table 2-4, what I'm laying out here are, essentially, the numbers for the different baseline years considered in this Fifth Methodology Order based on the technical working group meeting. So that was 2020, 2018, and they're comparing it to the average of the 2000-to-2021 period. And so, yes, you can see that precipitation is particularly low compared to the average there.

And what I'm proposing in this table is that I think the Department could have considered an average for the baseline year criteria in the Fifth Methodology Order, so I've included the average of '06 and 2018 to show that that also meets all of the baseline year criteria when you look at it compared to this current period of record, but it's much -- but it's more reasonable in terms of just being 101 percent of average for total Surface Water Coalition diversions more consistent with what's been chosen in previous orders.

Q. Okay. Thank you.

And in your January 16th, 2023, comments to the technical working group, did you raise these issues?

A. Yes, I did.

Q. Thank you. Let's move next to forecast supply.

What issues were identified at the 2015 technical working group meeting? Again, just briefly.

A. So I think, specifically, one of the reasons -- and it was definitely something that the Department put the most, it seemed like, time and analysis into -- was that the April forecast supply model for Twin Falls Canal Company needed to be improved. And so they looked at, basically, ways that they can improve that model. Just because of the way that they did the analysis, they evaluated the forecast supply models for all of the different Surface Water Coalition entities, and in the end they made a recommendation to change several of them.

Q. Thank you. And then Table 2-5 on page 22, can you just describe what that table shows.

A. So this is a list of all the different predictors that the 2015 technical working group considered at that time to improve the forecast supply models, and then you can see in bold, in this table, are the ones that actually got selected to be used in the forecast supply models.

And so I think in total here, we're looking

at -- almost 30 different predictors that would be --

HEARING OFFICER: Just a moment. Just a moment. We lost the audio. We need to back up.

Q. (BY MS. PATTERSON) Sophia, were you counting out, or were you trying to say something when you were doing that?

A. No. I'm sorry. That was just me counting in my head. I'm sorry about that.

So I was just saying that, essentially, they tested about 30 predictors to see which ones applied and how they can improve the models at those times.

Q. And you were looking at Table 2-5 and just counting out the different predictors that they considered in 2015?

A. Just roughly, yes.

Q. Roughly, yeah. Thank you.

Moving on to the 2022 technical working group, what was the regression models discussed there?

A. So we saw a presentation that basically showed the Department's evaluation where -- you know, since these models were developed in 2014, they're able to look at how the regressions compare as they add new -- as they add each new year of data so they can show us over the years how the regression models have performed.

And so that -- you know, that's one of the

analyses that they -- that's kind of the main analysis that they showed us for the 2022 technical working group.

Q. Let's go to Table 2-6 which is on page 22. What does this table show?

A. So this is the table that I've created to, basically, summarize -- from my understanding, it looked like they did try and see if they could make improvements to the forecast models. But this effort seemed like it was done not in the same manner as the 2015 technical working group, which had a really thorough and kind of prescribed approach to how -- to the predictors that they did.

It seemed like here they, basically, tested three new predictors. So the table that I'm showing are, in bold, the predictors that are already used in the model. And in this technical working group, they tested a couple wells and then, basically, the introduction of the Sentinel Well Index to see if those improved the forecast models; and they found that they did not, and so there was no recommendation to change the forecast models.

Q. Okay. And then in your section on current forecast supply predictor variables, can you explain your concerns that you have presently?

A. Yeah. So I think these are concerns that the Department had as well. It was part of their presentation to us. And that's that they, basically, showed us that for Twin Falls Canal Company in particular, what they see is that the R-squared value has been degrading over time to the point where -- and the R-squared value is, basically -- you know, it explains the predictive power for accuracy of the model, so the percent of variabilities that's explained by your forecast model.

And so it -- they see it degrading about 10 percent, and they see it consistently degrading every single year that it's input. And so I think that's a concern.

And I think we heard testimony that the concern is, potentially, that that model includes Box Canyon as a predictor. They talked about the shift that's observed in Box Canyon. I think that's a concern. When you look at just the water year summary for Box Canyon, it also talks about it can be influenced by irrigation return flows from Rimrock.

And then I have a concern for Box Canyon as a predictor just because physically Box Canyon discharges from a completely different reach of the Eastern Snake Plain Aquifer, and, actually, when you look at kind of

historical discharge from the Kimberly to King Hill, which is the reach that Box Canyon discharges to, compared to the near Blackfoot to Minidoka reach, they have different responses to, basically, changes in the Eastern Snake Plain Aquifer over time.

And so to me, just logically, it's a questionable predictor, and it's probably just correlated with something else, and that's why it doesn't perform very well in the model.

Q. Do you recall the testimony from Matt Anders where he discussed the Department's decision to -- and I don't have the exact quote -- but just monitor and reassess the Box Canyon data in the future?

Do you agree with his statement?

A. Yes. I think they should be concerned about using Box Canyon as a predictor. And I think not -- I think that there's a really good reason for them to do a comprehensive review of how the forecast supply models are done, similar to what was done in 2015 with casting a wide net of predictors that are more pertinent to the near Blackfoot to Minidoka reach, and that just wasn't performed. And I mentioned this at the beginning of my testimony, I think that this should be performed to see if there is a better predictor for the forecast supply models, particularly the Twin Falls, given the

degradation.

Q. Matt Anders also said that, you know, there's a chance that the Box Canyon R2 could stabilize or perhaps improve in the future.

In your experience, do you think that's likely?

A. I mean, they have not seen it improve from one year to the next in any year that they've employed it; so just based on the record, I think that that's unlikely. It seems like it's more likely to further degrade.

Q. Thank you.

And then you mentioned also in your report a well, 05S31E27ABA1. I think -- you can just refer to that as ABA1.

What was your issue with that?

A. You know, this is just something that I have from experience because this is one of the sentinel wells. It's something that -- you know, there's a technical working group around the sentinel wells to evaluate whether they're a good representation. I think we've sort of flagged this well as it's not really necessarily, being representative of aquifer conditions and that it's probably more representative of sort of surface water irrigation practices or maybe American

Falls Reservoir levels than it is kind of regional or even local aquifer conditions. And so I know that this well -- and I didn't have much time to evaluate the July forecast model, but this well is used in some of those July forecast models. And so it just catches my eye in terms of, you know, that should probably be reevaluated as well.

Q. Thank you.

And do you have any other recommendations on improving natural flow models that you haven't already discussed?

A. I think just in addition to doing a more comprehensive and really more objective approach to the forecast supply models, like a stepwise linear regression that has the very specific criteria that, basically, establishes the significance of including or omitting variables, and these are just standard methods that can be applied, I think that should have been done.

And then the other thing that I've mentioned in both my 2015 and 2022 comments is the idea that, at least from my perspective, it seems like we have a good forecast supply that comes out of the joint forecast for Heise. And I don't quite understand why we can't use forecast supply from there to kind of develop an allocation model that, basically, takes the water rights

administration in this reach into account to determine what is available to the individual surface water entities without coming up -- you know, which would avoid having developed our own forecast supply models that are forecasting administration effects, which I think is difficult.

Q. Okay. Thank you. Let's move on to reasonable carryover.

Can you explain briefly what that term means?

A. Yes. So reasonable carryover, it's basically to establish the carryover needs of the various Surface Water Coalition entities for the next surface water -- for the next irrigation season. And so the way that they calculate that in the methodology is the baseline year demand minus the projected supply, and so they use -- for projected supply, they use an average of historical supply -- which, again, they're choosing a below average. I think they use maybe '04, '06, and they didn't change that in this methodology.

But something that was brought to the attention of the technical working group really late in the process, and there really wasn't any analysis around, was that the baseline year selected as 2018, because it has such higher demands for the Surface Water Coalition entities, it really changes -- it changes that

calculation as a reasonable carryover in terms of there being, more often, shortfalls determined for the reasonable carryover.

Q. And are some of your concerns reflected in Table 2-7; or can you explain Table 2-7, which is on page 25?

A. This just shows the difference in choosing the baseline year and the change of the baseline year in the Fourth to the Fifth. And so you can see that, for some entities, we're only talking about a 4,000-foot increase, but some of them, the change is like -- if you look at AFRD2 there, you go from is 11,500 feet in the Fourth Methodology Order to 93,000 acre-feet in the Fifth.

Or similarly, if you look at North Side Canal Company, in the Fourth Methodology Order, their carryover needs were 65,000 acre-feet, and in the Fifth they're, you know, over 110,000 acre-feet.

Twin Falls Canal Company went from 25,000 acre-feet to over 85,000 acre-feet.

And there really wasn't any analysis presented to the technical working group around whether there was a need for these massive increases to carryover needs. Like, historically, can you show that the carryover has been insufficient, you know, to these levels for those

entities.

Q. Thank you. Let's move on to your section on compounding bias.

You state: [As read] "The Fifth Methodology Order leads to curtailment of every junior right on the ESPA in most years even though TFCC records demonstrate that it is short of water only occasionally."

Can you explain that statement?

A. Yeah. So to explain that statement, we need to look at Table 2-8.

Q. Okay. And that is on page 26.

A. Okay. So this table was based off of, essentially, a hindcast analysis that Department staff put together where they were showing the difference from the period of 2000 to 2022 between using a baseline year -- the previous baseline year and then the update to using 2018 as the baseline year.

And so in this table, what I've pulled out is the April baseline year shortfall is, essentially, the second column here after the year in this table. And then from that shortfall, that would be determined from the Department's analysis using 2018 as the baseline year. I've used -- Jennifer Sukow provided a series of ESPAM model datasets that were used to generate the figure that we've been over in previous testimony that

basically shows -- she created a curve that showed various curtailment dates under the transient ESPAM model and the associated shortfall.

And so I took those model files and, basically, tried to find the curtailment date that she had run that produced a benefit to the near Blackfoot to Minidoka reach that most closely approximates the April baseline shortfall using 2018.

And so the comment that you specifically mentioned, I'm basically highlighting every year that the shortfall determination is over 97,000 acre-feet, which means whenever there is a shortfall above that, it's a full curtailment to the 1900 curtailment date, and that's 941,000 acre-feet of junior groundwater acres curtailed. And so when you look at the hindcast of these 23 years, 16 of the years result in complete curtailment to that 1900 date.

And then in the very last column, from some information provided by Twin Falls Canal Company, I think related to their deposition, there was, basically, a record of what their diversion rates were -- I think maybe starting in the '90s. And, basically, I just -- in the column for each year, I included every diversion rate, and I am highlighting, basically, years that have a diversion rate that is less than five-eighths.

And there's only 4 years out of the 16 years that have shown that they've diverted less than the full diversion of five-eighths versus the 16 years that, you know, 900 -- over 940,000 acre -- junior groundwater acres are curtailed. And so this just kind of demonstrates what I was discussing in the selection of the baseline year; that when you shift 2018 as the baseline year at the higher percent of SWC diversion, there's really no balance in terms of any protection against unnecessary curtailment of the juniors.

Q. Okay. Thank you.

Let's go next to the impact that nonirrigated acres has when it's included in the RISD November actual demand shortfall calculation.

On page 27, there is Table 2-9. Can you explain that?

A. So, again, I am pulling some data from the hindcast analysis that the Department did where, in addition to presenting information from 2000 to 2022 for the April demand shortfall, they included the November reasonable in-season demand for shortfall. So in November, the baseline year is no longer a component, and the shortfall is completely determined based on the reasonable in-season demand calculation.

And all I'm doing here is, basically, instead

of using the acres that the Department is using in the Methodology Order, I'm just using the acres -- and I've only done this for -- oh, no, I did all of them -- so I'm only updating the acres for Twin Falls Canal Company, which is the one we have very consistent evidence that it's nonirrigated acres.

And so for Twin Falls Canal Company, I'm, basically, updating the acres used in the reasonable in-season demand calculation sheet to be whatever the most recent irrigated lands dataset is; or for 2021 and 2022, I'm using what the Department reported in terms of 2021 near real-time METRIC acres. And I'm just showing the difference in the shortfall that you calculate by using those more accurate acres for Twin Falls Canal Company.

Q. Okay. Thank you.

Moving to your next section, you've got a Table 2-10. Can you explain this table and how it relates to bias in April and July?

A. Sorry, that actually should be -- that's a typo. This really just refers to April.

Q. Oh, okay.

A. The April forecast. Sorry, that's my mistake.

But in the April forecast, the -- so in April, the shortfall is the baseline year -- is the forecast

supply minus the baseline year demand, and so -- and the forecast supply comes out of the forecast supply models. And those forecast supply model predictions are each reduced as a measure of bias or, essentially, in favor of the senior. They're reduced by one standard deviation. So we don't use the forecast supply that we actually predict; we use less than that.

And so what I'm tabulating here is basically what one standard deviation is for each of the Surface Water Coalition entities in terms of their forecast supply models. And so just off the top of those, you know, again, we focus on Twin Falls where we're reducing, just to be protective, another 50,000 acre-feet.

So maybe these are all reasonable, but they -- individually, it's just important to remember that if we're adding a bias in terms of the demand by choosing a higher baseline year of 60,000 acre-feet, we also have to remember that we're reducing the supply by another 50 -- you know, 50,000. So we're sort of starting with over 100,000 acre-feet of, you know, potential shortfall depending on the year just based on that.

Q. Okay. Thank you.

And then your next section bias in the 2018 baseline year for reasonable carryover, is there

anything new that you need to address here?

A. No. Like I said -- I mean, I didn't do -- I didn't -- I wasn't able to do an analysis of, essentially, a hindcast that would show the difference in curtailment date from -- which is also calculated at the time that there's a shortfall to the reasonable carryover. So I don't have that information.

But what I do have is, essentially, information that was presented to the technical working group that I'm showing in Figure 10 that, basically, just shows how this bias will create shortfall in so many more years in the Fifth Methodology Order compared to the Fourth.

So I'm showing the information from Twin Falls Canal Company, and in the columns labeled either the Fourth Amended Methodology Order or the Fifth Amended Methodology Order, I'm, essentially, highlighting years. And this isn't me; this is information from Matt Anders that he presented to us. It highlights years where a reasonable carryover shortfall would have been calculated.

And you can see that over the period using the Fourth, there was only three years where a carryover shortfall would have been determined, and these are mostly in very dry or dry years.

And then you see with the shift in the baseline year that to 2018 that occurs in the Fifth, we're now looking at, you know, most of the record is going to have a shortfall, and these are going to occur in even average or above-average years.

Q. Thank you.

And then just to close out the section, are there any other sources of bias in the methodology?

A. So I touched on it a little bit that when I reviewed 2018, and I looked at the Department's spreadsheet for, essentially, their adjustment, where they take into account either wheeled water or recharge that has occurred -- and I only did this for 2018, but I think it could be done for other years, and it could, potentially, lower total Surface Water Coalition diversions that we're using in the baseline year. So that's a concern of mine.

But just reviewing 2018, I can see in the spreadsheet that there's, basically, a note -- I think it's for AFRD2 -- that it was reported that either 5,000 or 10,000 acre-feet was recharged, and the Department has only accounted for, in their calculation, 5,000 acre-feet.

And then, additionally, based on the settlement agreement reporting that is submitted by IGWA

to the Surface Water Coalition, it looks to me like there is another 4,000 acre-feet of recharge that occurred in 2018 on the North Side Canal Company that's not included, and so that's about 9,000 -- that's, potentially, 9,000 acre-feet of -- you know, in my opinion, I think just error, but maybe bias in -- in the baseline year that will occur every year -- you know, that it's part of the baseline year, so that will always be there.

And then another -- I think this has been testified to. You know, another just consistent source of bias is that the supplemental groundwater acres as either a reduction in acres or a source of supply is not being taken into account. We don't know what level, I guess, that occurs, but we know it does occur, so that's just consistently in there.

And then I think --

Q. Oh, please continue. Sorry.

A. You know, I think this has maybe been discussed as well, but I think just another source of potential bias in the way the baseline criteria are laid out is that increasing diversions by the Surface Water Coalition entities just, ultimately, result in increasingly higher baseline-year criteria to meet and, ultimately, a higher baseline year determined.

And so there's not really incentive to be efficient with Surface Water Coalition diversions. There's actually, seemingly, just based on the methodology, there's incentive to keep your diversion as high as you can because it ensures that in the future more and more water comes.

Q. Thank you.

One last question: Did you raise the issue of the supplemental groundwater with the Department in the past?

A. Yes. Those were in my comments in 2015, and they were in my comments in 2022.

And I think, you know, from my experience, which has a lot to do with the ESPAM model, I know that we do account for mixed source lands in the ESPAM model and that there is a dataset available. And I saw some notes from Matt Anders that looked like they were prepared for the 2015 technical working group that looked like -- it seemed like he was considering that that dataset from the ESPAM model for mixed source lands could be used in the Methodology Order.

And so it's not clear to me why that can't be advanced or, you know, why we can estimate it in the groundwater model, but we can't in the Methodology Order.

Q. Okay. Thank you.

MS. PATTERSON: Director, we've got one last section of the report to go through, so I think we're about two-thirds of the way done.

HEARING OFFICER: Let's break.

MS. PATTERSON: Okay.

HEARING OFFICER: Let's break for 15 minutes, come back at a quarter to the hour.

(Break taken.)

HEARING OFFICER: Are we back on the record?

COURT REPORTER: Yes.

HEARING OFFICER: Thank you. Mics are on.

Ms. Patterson.

MS. PATTERSON: Thank you.

Q. (BY MS. PATTERSON) Sophia, before we move on to your section on the ESPAM model, I just want to do one item of cleanup.

When we were discussing the irrigated acres, there was a quote from your report that said the "irrigated acres consistently shows that TFCC is irrigating approximately 15,000 acres less than the 194,732" number.

You may have misspoke and said in some of your testimony that it was 15,000 acre-feet. I just want to confirm, did you mean it's 15,000 acres?

A. Yes. Acres.
Q. Thank you.
Moving back to your report on page 30, you have a section called, "Simulation of Curtailment of Junior Groundwater Rights Using the ESPAM Model."
Can you please explain some of the background.
A. The ESPAM model is used in the As-Applied Order to determine the curtailment date that comes up with the -- that meets the demand shortfall obligation. In this section on background, I'm describing the development of the ESPAM model and, essentially, that it's done under the -- it's the Department's model and done under the advisory of what's called the Eastern Snake Plain Hydrological Modeling Committee.
Q. And you said before that you participate in this group, the committee?
A. That's correct.
Q. And so you're quite familiar with the model?
A. Yes. I've been, I think, part of that committee in working with the model for over ten years.
Q. Can you explain a little bit about the model structure?
A. Yeah. So I think in terms of the testimony I'm going to give today, what's important about the model structure is that it's a single layer throughout

the entire model. It's a single-layer model, and it's defined with homogenous isotropic properties, which means that it, basically, doesn't differentiate between horizontal and vertical hydrologic conductivity, which relates to how quickly or easily water moves through the aquifer system.

Q. And then tell us a little bit about the calibration process.

A. Sure. So when you develop a model, you build the structure and you build the boundary conditions that you think best represent reality in a simplified version in the model, and the model is calibrated, basically, over a historical period where you've developed various sets of model input data, like groundwater consumptive use or tributary inflow, and then the model is, basically, calibrated over that historical period. And it's calibrated based on trying to get the best match to historical observations of what are called "model targets."

And those historical observations are typically, things like water levels in the aquifer and reach -- basically, reach gains or spring level -- spring discharge data, so you're -- in calibration you're trying to get the best fit with those historical observations.

With the ESPAM model, they used an automated calibration tool that's called PEST. And the way that PEST works is that the modeler, basically, gets to assign PEST a certain set of parameters that it's allowed to adjust up or down based on ranges that the modeler gives it.

I think in terms of my testimony that I'm going to give today, it's important to understand that the parameters that PEST is allowed to adjust in its model calibration process is aquifer properties like the transmissivity and the storage of the aquifer, and then it's also allowed to adjust water budget components like tributary underflow values and nonirrigated land recharge.

Q. Thank you.

And you've got a section on model uncertainty. Why did you feel it important to discuss this?

A. Yeah. So, you know, all models inherently have model uncertainty. Because of what I said, they're basically a simplification. There's model uncertainty around the target observation that we put in, so when we're trying to get it to match the reach gain, like the near Blackfoot to Minidoka reach, that's subject to just error, like in the observation in the target data, like reach gain error around the gage measurement. But it's

also subject to, essentially, errors that are caused by uncertainty that we have in the water budget components or the aquifer properties themselves.

And so we have uncertainty around, like I said, the aquifer properties in some of those model budget components, and that's why we allow PEST in the calibration process to adjust those. So that's one type of model uncertainty around water budget components.

And then there's another type of model uncertainty that just has to do with how the model is built conceptually and how well that conceptual model matches the reality.

And I think when we look at, basically, the hydrologic controls on the discharge, the near Blackfoot to Minidoka reach, which is the particular prediction that we're using ESPAM for in this surface water delivery call, there's significant limitations in the conceptual model of the ESPAM in that reach.

Q. And you note in your report on page 32 that no amount of data improvement resampling or recalibration can correct errors stemming from incorrect or simply incomplete model conceptualization.

In the Blackfoot to Minidoka reach, are those sort of what you're talking about where there's just some things built in that you're not going to be able to

calibrate around?

A. That's right.

So, you know, PEST is going to do its best to match the model results with the targets no matter how we build the model. And so if you build the model wrong in that area, it's going to match the observation, as well, in terms of the calibration process, but it's not going to match them for the right reasons because it's not built the right way. And I think that's, essentially, the point there.

Q. Thank you.

And under 3.4.2 of your report, you talk about the Blackfoot to Minidoka reach.

Can you explain kind of what you would want to see in the model to address this issue?

A. Sure. So what I'm referring to a lot in this section -- I'm referencing a report that was done in 2008 by Ralston -- I think -- Engineering Services, and it was done for the Department, prepared for the Department. And it's, essentially, a look at how the model -- and they're evaluating ESPAM1.1, I think, based on the date there, but these same conceptualizations, the same in this area in ESPAM2.2, so it all applies.

But it's, essentially, a critique of how the model is built in that area, because they lay out

geologic -- the hydrogeologic framework that shows that the model actually is -- or the aquifer is very -- has multiple aquifer layers and what are called aquatards or impermeable layers within the aquifer that are, essentially, the main controls on what's dictating the discharge in the near Blackfoot to Minidoka reach.

And because the ESPAM model is a single-layer model that doesn't have the vertical hydraulic connectivity represented, it's not able to re-create the flow conditions in terms of the major controls, which it's laid out through the -- based on the geology there, we know that there are significant vertical flow components that lead to the discharge in the near Blackfoot to Minidoka reach.

Q. And on page 33, you have Figure 3-1 and 3-2. Are those figures from the Ralston report?

A. Yes. So these are excerpts from that report that are taken from previous hydrogeologic investigation. And, essentially, what I'm trying to illustrate in 3-1, this shows, basically, the interlayered nature the interfingering of the aquifer system, which is shown in kind of the darker vertical line stippled -- or dashed area, and then the impermeable layers that are shown as kind of the stippled lighter areas in that figure.

And so what happens -- and I think it's, basically, what is controlling the discharge to the near Blackfoot to Minidoka reach -- is that the main aquifer system, basically, encounters these very impermeable layers in the vicinity of the American Falls reach, and that forces -- because they can't move through these impermeable layers, it forces the water to discharge to that reach, but it's going to be discharging vertically, basically, through these interconnected hydrologic aquifers.

Q. Okay. Thank you.

So if I understand, that section relates to kind of the framework of the model and, you know, issues that might be there?

Can you explain 3 -- 3.4.3 section on page 34 of your report?

A. Yeah. So what we just went over were, essentially, the aspects of the conceptual model uncertainty. What this section talks about is uncertainty around our input parameters, and so what I'm referring to in this particular section is the aquifer properties.

And so the aquifer properties are transmissivity and storage, and those two combine to, basically, control how quickly or slowly water will move

through a system. So if we think about the curtailment simulation for the Methodology Order, it's, essentially -- controls how a reduction in groundwater pumping in one area will propagate to the near Blackfoot to Minidoka reach will be based on those aquifer properties, and we have uncertainty in those aquifer properties.

And so they're something that are adjusted during model calibration, and so we'll get -- these will change as new -- as each new version of the model comes out. And so that's, more or less, what I'm describing, kind of the evolution of these properties with the versions of the model.

Q. So why don't you, then, explain your next section, which compares ESPAM1.1 to 2.2?

A. So are we looking at, like, Figure 3-3?

Q. Yes. And that is on page 36.

A. So here in this figure, I'm, basically, showing -- I know you can't read these figures -- and so I'm showing the distribution of one of those terms, "transmissivity," so sort of the resistance to which water can move through the system. What I'm showing for each version of the model is the mean transmissivity, and so you can see how these values from ESPAM1.1 to 2.1 -- and then change.

I've got -- on the left side of this figure, I'm describing the ESPAM2.2 model that was proposed to the Eastern Snake Plain Hydrologic Modeling Committee in January of 2020, and then I'm also showing, above that, the actual version of ESPAM2.2 that was accepted, which was proposed in September of 2020.

And what I'm going through -- the reason I'm going through this evolution in this section is that when the version that was proposed in January was presented to the Eastern Snake Plain Hydrologic Modeling Committee, I did a review of the model, basically, looking at how the calibration -- how the calibration had turned out. And then, as I've mentioned prior in testimony, I do a lot of analysis for my clients, IGWA, around using the model.

And so I ran the model -- I ran some of those basic analyses that I do all the time with the new version of the model, and I was seeing really, really drastic changes in terms of what it was predicting for water levels, like at the sentinel wells, for example, or what it was predicting in terms of what responses to recharge activities were going to be.

And so in January, I raised those concerns to the committee saying that, essentially, the changes that we were seeing -- that I was seeing in the model -- I

think were hard to explain based on the structural changes that we made to the model. And I just -- I had concerns about -- particularly, one of the main inputs that we had changed to the model was one of the water budget components.

It was, essentially, introducing the METRIC data to calculate consumptive use. And I thought that that was probably a likely change for -- you know, I thought that that input and, then, how the model dealt with that input, in terms of its calibration, was kind of -- was a likely change for what we were seeing in terms of such widespread differences in aquifer transmissivity.

And then particularly if we go to the next figure, that shows the same thing for storage in terms of the evolution between the models and the storage values average across, there again, changing very drastically. And that's really, really changing the type of model predictions that we're getting.

So I just raised this concern to the committee; that I thought before we release this version of the model, there was some things that I thought we should analyze, to check out to make sure that we were comfortable with what was resulting from the calibration.

Q. Okay. When you said "the next figure," are you referring to Figure 3-4 on page 37?

A. Yes. So this shows the storage, which, ultimately, I think, was probably one of the main drivers for the differences that we are seeing in predictions in terms of water levels and responses for reach gains -- through reach gains.

Q. Moving to the next page, 38, you have Figure 3-5.

Can you explain this chart?

A. Yeah, so in this chart, I think you should focus on the yellow lines in this figure. And, essentially, this is a really standard analysis that the Department does with any version of the model that they release, and it shows a curtailment response. In this case, we're looking at curtailment of groundwater rights junior to 1961.

And the dashed yellow line shows the response to the near Blackfoot to Neeley reach using version ESPAM2.1, and the solid line shows the predicted response to that reach using ESPAM -- the accepted version of ESPAM2.2.

Q. And what does this difference mean?

A. So these are -- it's just a difference in what it predicts under the different model version. And I

think it's about a 20 percent difference in terms of what they predict. And the difference in the prediction has to do with, essentially, what I was talking about, how those aquifer parameters influence the timing of responses from a reduction in groundwater and how that moves to the reach.

Q. And then can you explain Figure 3-6?

A. This compares, again, the ESPAM2.2 and ESPAM2.1, what the steady state response function is, so the percentage of water from each model cell that would result in -- essentially, if you stressed any one of these model cells, the percentage of that stress that would impact the near Blackfoot to Neeley reach under steady state conditions.

And so, again, just the difference in the distribution of these shows the difference in the timing and -- that results from changing to this new version of the model.

Q. You discuss, on page 39, the ESPAM water budget component uncertainty and the current model.

Can you just go through that and explain some of the uncertainties?

A. Yes. So this was related to the concern that I brought up to the committee in January of 2020 when they proposed their first, potentially, version of

ESPAM2.2. And the differences I saw is basically what I reviewed from calibration -- from the calibration results where I had mentioned that PEST, the tool, is allowed to adjust water budget components up or down to better match the observed targets.

And if we turn to -- you're looking at Figure 3-7; is that what you're looking at?

Q. Yes, on page 40.

A. Yes. So when you look at Figure 3-7, the initial estimate for -- what I'm showing on the left there is the initial estimate for the volume of annual recharge -- natural recharge to the reach. And what we see -- precalibration is the blue line, and postcalibration is the orange line.

And what we see is that PEST is trying -- so that it's able to match the observation, it's increasing the amount of natural recharge components across the ESPAM model pretty significantly. And I've put a couple of those components on the right side of the graph where the lines represent the same thing.

Blue is precalibration and orange is postcalibration, and we're looking at tributary underflow, and then we're looking at recharge on nonirrigated lands. And so what we see is that for the model to be able to calibrate, it's having to increase

the amount of tributary underflow or nonirrigated land recharge to compensate for that.

And what we saw -- what we saw in the storage is that we also saw the model had to significantly increase its aquifer storage values.

And all of these things combined tell me that it seems like PEST it trying to adjust for the fact that we're taking too much water out of it. It's working really hard in calibration to get more water into the model wherever it can, either by increasing the aquifer's storage or by increasing these water budget components.

And so I had questioned to the committee -- because I was part of --

COURT REPORTER: I'm sorry, Ms. Sigstedt, I think I missed a little bit. "And so I had questioned to the committee"?

THE WITNESS: I questioned to the committee the use of the METRIC processing that we were using.

Q. (BY MS. PATTERSON) Okay. Go ahead and continue from there.

A. And the reason that I questioned the METRIC processing was because I was part of a technical working group that discussed how the METRIC data would be processed, and I remembered that they were choosing,

basically, whether to apply a buffer or sort of an increase in the area around the actual field irrigated area to -- they were trying to decide what buffer area they would use to process the METRIC data.

And I remembered in that committee that there wasn't really a well-justified reason for the buffer that they ultimately decided that -- they were considering like two or three different buffer areas, and, ultimately, they just chose the largest one which had resulted in the largest estimate of ET. And I was concerned that maybe it was that processing that was creating us to overestimate the METRIC application in ESPAM that results in one of the largest model components, which is the groundwater consumptive use component of the water budget.

And so in my recommendations to the committee in 2020 when they proposed this model was that they do a sensitivity analysis around that processing and just either try and verify the processing they were using by looking at, you know, a field verification or something like that or, like, an on-the-ground verification of the number that they were using or just test the model to the sensitivity of using -- of processing the data some of the other ways that they proposed and see if one of those helped with this calibration or how much it

influenced the calibration.

Q. So was the idea trying different methods, running through and seeing kind of what the parameters look like on Figure 7.3, and seeing if those improve with different runs?

Was that the sensitivity you were requesting?

A. Exactly, just seeing how it changed. So if we tried some of the other processing methods, would the -- would this preimposed calibration of, you know, the tributary underflow or the -- the nonirrigated lands recharge, would PEST seem to adjust those less.

And then on the -- like I said, the storage value, the change in the aquifer storage value, was something I was really concerned with, mainly because in calibration, we have a preferred value for that storage. It's something around.205. And you can see that, if you look at the evolution of that figure, each version of ESPAM2.2 is moving further away from that. And so to see if our -- the change in the storage wasn't as drastic testing the sensitivity to that under the different processing method.

Q. Thank you.

Can we move to page 41, Figure 3.8, and can you explain to me what this addresses.

A. So ultimately, the Department chose not to

take the recommendation that I gave in January to test those parameters, and they did do some -- I think they extended the model calibration period, which was another recommendation I made, before they proposed another version of this model of this ESPAM2.2 model in September, and in September they asked for the committee to, basically, have a vote to accept that model. That was, ultimately, the version that was adopted as ESPAM2.2.

Following that meeting, the Department asked for recommendations from the committee about future improvements to ESPAM, we just start working on the next version of the model immediately. In those recommendations to the committee, I again brought up this issue that I discussed around, you know, some kind of verification of the METRIC processing.

Ultimately, the Department did do that, and when they looked at sort of a preliminary field investigation of the processing and then they also compared their METRIC processing to some open source metric.

So the in-field investigation looked at using the diversion data compared to the METRIC processing, kind of a field-by-field basis, and then they also compared their METRIC processing method to just some

open source ET data. There's a couple of different sources they could see. And what they consistently saw was that their method produced a much higher ET rate than any of the open source data or the comparison to the diversion data.

And so they consulted with ET -- or more like METRIC specialists or experts -- and they, basically, reviewed the processing method the Department was using, and they did say that it should be -- that that was probably not the correct way to do it and that they had a different recommendation for how that processing should be done. And then the Department has basically done an initially recalibration using an alternative processing of the METRIC data, and that's what I'm showing in Figure 3-8.

So on the right side of this figure is the current ESPAM model for those same aquifer properties we were looking at, transmissivity and aquifer storage; and then on the left is the preliminary recalibration of the model. And so, you know, particularly for storage, what you see is that the value is going down, you know, is a lower -- closer to that preferred value of .05 that we have.

And then if we move on to the next figure, which is 3-9, I've highlighted -- or this is really,

actually, Jennifer's figure, where she's highlighted some of these water budget components that I touched on.

So we've got the ESPAM2.2 value shown in green for the water budget component, and then we have the precalibration refined METRIC processing value shown in gray. And then we have the postcalibrated with the new processing method shown in blue.

And so what you see is that this eliminates that concern that I highlighted earlier where when you compare the gray bar to the blue bar, which is precalibration versus postcalibration, we see that the -- that FS isn't having to adjust those model parameters anymore. Precalibration and postcalibration, the values are pretty similar.

But also what we see is that there's a huge difference in some of these components. Like, I think, nonirrigated recharge and tributary underflow, we're looking at like 300,000 acre-feet differences between ESPAM2.2 and this preliminary calibration model; and for groundwater CIR, we're looking at a difference of like 600,000 acre-feet.

So what this highlight s for me and the reason that I'm bringing it up here is that we just have significant uncertainty in these model -- these water budget components right now in the model, and it's

leading to significant uncertainty because of the way the model is calibrated, and it's able to adjust both water budget and aquifer parameters. At the same time, it's leading to significant uncertainty in the water budget -- I mean, in the aquifer parameters.

And, you know, this preliminary calibration, the storage value that we see, is getting a little closer to, you know -- a little closer to what was in 2.1. And so when I showed you, before, the response from curtailment, the difference between 2.2 and 2.1, we're, again, going to see a shift whenever the next version of the model is released, which, you know, won't be for years, probably. But it will again change that prediction. And we sort of already know at this point that it's wrong.

Q. Thank you.

Let's move next to Section 3.4.4, and if you can just explain this section and the Table 3-1.

A. Yeah, so this is just a section that kind of describes some of my conclusions, again just kind of relating the fact that we have this aquifer uncertainty and that it -- I mean, that we have this model uncertainty -- and that it directly affects the prediction that we're making at this near Blackfoot to Minidoka reach for the methodology.

The table is an analysis that was done by Jaxon Higgs, who couldn't be here to testify, so I went over the analysis with him, and I'm going to testify on it today.

And, essentially, what it lays out is -- it takes the model files that the Department produced as background data for the current curtailment date for this April As-Applied Order, and it splits it into -- it splits it geographically by groundwater district to see how each district's reduction in pumping affects the near Blackfoot to Minidoka reach.

And so if I just go through the columns, we've got the first column is just IGWA's proportionate share broken down by districts that comes from that curtailment.

And then if we move to the column that is the transient May-through-September impact, that's, basically, by district what impact comes -- you know, what will show up within that first season from the curtailment for each district. And then the next column shows the curtailment volume, so the amount of acre-feet curtailed within each district. And then the next column is basically the ratio of those two.

And so what we see is that the response from each groundwater district, because of its distance or

hydrologic connection to this reach, is really variable in terms of the type of benefit that we get for how you curtail to near Blackfoot to Minidoka reach gain.

And, you know, particularly if we go to some of these districts at the bottom and we look at, like, Jefferson Clark, Magic Valley, North Snake, we see -- and then, you know, we can see that the response to what they get at the reach is extremely low compared to what they have to curtail.

And so, again, moving through this column, there's the next column that, basically, tabulates by district the number of acres that are curtailed. And so we can see, just kind of adding up some of those bottom districts with the lowest response, we're talking about in the vicinity of 300-, 400,000 acres that are curtailed that have almost no in-season benefit to the near Blackfoot to Minidoka reach.

And I think that those are probably my main conclusions from this.

Q. Thank you.

A. I guess -- actually, I guess it is also interesting to look at the next two columns, which is percent of acres curtailed, and you can just -- again, just illustrates for a year like this, using the transient model -- for a lot of these districts, you're

talking about, you know, 70 to 97 percent of the groundwater acres in those districts are curtailed under this type of curtailment date.

Q. Thank you.

The last section is your summary of conclusions. I think we can go without you reading these on the record, and I will just move to admit Exhibit 837.

HEARING OFFICER: Any objection from the parties?

Hearing no objection, the document marked as Exhibit 837 is received into evidence.

(Exhibit 837 received.)

MS. PATTERSON: And that will be -- I'm done.

HEARING OFFICER: Any further questions of Ms. Sigstedt from the groundwater users group?

MS. McHUGH: I have questions.

HEARING OFFICER: Ms. McHugh?

MS. McHUGH: Should I sit there?

HEARING OFFICER: You're welcome to sit here.

DIRECT EXAMINATION

QUESTIONS BY MS. McHUGH:

Q. Good morning, Sophia. I just had -- I wanted to make sure I understood your testimony correctly

relevant -- I think it's to Exhibit 826. It's a table where you did a hindcast. It's Table 2-8, the hindcast of what the impact is for using 2018 as a baseline year.

A. Okay.

Q. And I just wanted to ask you about -- just make sure I understood your testimony about what you would expect going forward now using the 2018 baseline year.

A. I think we can expect that in most years, the aquifer is going to be curtailed to pretty much -- potentially, it's -- all of the junior groundwater acres are going to be curtailed more than half of the time, 60 percent of the time if we just use the hindcast.

And then using -- also looking at the hindcast, we can see that there's only four years out of this 20-year period where less than 300,000 acre-feet of junior groundwater acres are curtailed. So I think, you know, almost every year you're going to see more or at least 300,000 acre-feet of junior groundwater pumper acres curtailed using the 2018 as the baseline year.

Q. And when you say -- when you mean "curtail," you're meaning that in the analysis for the As-Applied Order in April, there will be a forecast of shortage to at least one member of the Surface Water Coalition; and what I understood you to say over -- in at least

66 percent of the years going forward?

A. I think 60 percent of the years.

Q. Okay.

MS. McHUGH: That's all I wanted to ask. Thank you.

HEARING OFFICER: Okay. Other questions from the groundwater group?

All right. Cross-examination.

Mr. Simpson.

MR. SIMPSON: Yes. If we could go off the record for a moment. I can move all my stuff up there and get organized.

HEARING OFFICER: Yes. Okay. Let's go off the record.

(Break taken.)

HEARING OFFICER: Let's go back on the record, Andrea. We're recording.

Thank you, Mr. Simpson. You may examine Ms. Sigstedt.

CROSS-EXAMINATION

QUESTIONS BY MR. SIMPSON:

Q. Ms. Sigstedt, good morning. My name is John Simpson. I'm one of the attorneys for A&B Irrigation District, et al., and I'll be cross-examining you this

morning.

Is it okay if I call you "Sophia"?

A. Yes, that's fine.

Q. Thank you. So, Sophia, from your direct testimony this morning, you've been working on these issues on conjunctive management on the ESPA for well over ten years; is that correct?

A. I think, yeah, over ten years.

Q. Okay. And during that time, you've been retained by IGWA specifically for those efforts?

A. That's correct.

Q. And you mentioned in your direct testimony that in approximately 2012, around the time you started working for IGWA, you worked on the modeling in the Rangen case.

Do you recall that testimony?

A. Yes.

Q. And in that case, did you use the ESPA model as a part of your tasks that you performed on behalf of IGWA?

A. Yes.

Q. Okay. And did you use that ESPA model in the version that was then present because it was the best science that was available for your efforts?

A. I think so.

Q. Okay. If it was the best science available at that time, would you agree that it's the best science available today to estimate or predict the responses of the aquifer to stresses such as groundwater pumping?

A. I do.

Q. And that would include stresses in every reach of the Snake River, including the near Blackfoot to Minidoka reach?

A. Yes.

Q. And in using the model, have you used it in both the steady state and the transient version?

A. Yes.

Q. And in your opinion, is the transient version of the model and running of the model the best predictor of what would need to be accomplished on the aquifer to deliver water into the Blackfoot to Neeley reach -- or excuse me -- the Blackfoot to Minidoka reach?

A. Over what time period?

Q. In the -- in the present irrigation season.

A. I think it's the only version that can predict in the present year of irrigation season.

Q. So if we're attempting to use the model to identify what actions need to be taken on the ESPA to deliver a volume of water into the Blackfoot to Minidoka reach during the irrigation season, the transient model

would be the only version to use; is that correct?

A. That's correct.

Q. During your direct testimony, Sophia, you discussed the efforts in early 2015 by the technical work group.

Do you recall that testimony?

A. For the Surface Water Coalition technical working group?

Q. Yes.

A. Yes.

Q. And in looking at the comments that were provided by you on behalf of IGWA and then the recommendations made by Department staff to the Director as a result of those efforts, do you recall the time frame under which those comments were made?

A. I think you would look at the dates of the memos. I think mine were in March.

Q. Right. And so, I mean, you testified that there was a limitation of time -- a limitation of time at that point that limited the number of issues to be discussed or recommendations to be made.

Do you recall that testimony?

A. That was in the Department's conclusions and their recommendations.

Q. And do you believe that limitation was in

reference to the work that was completed in March of 2015 relative to the irrigation season that was then pending?

A. I don't know.

Q. You testified earlier today regarding the -- on page -- I believe it's on page 10 of your report Table 2-3, if you'd turn to that, please.

And this is a summary of the SWC irrigated acres, the 2022 technical work group, is it not?

A. That's correct.

Q. And you described earlier the various columns and the basis for the various columns, that is either the shapefiles or the irrigated lands datasets that were generated by the Department; is that correct?

A. That's correct.

Q. And would you agree that for the irrigated lands dataset, the 2011 or the 2017 or the METRIC processing acres 2021, that those are just a snapshot in time?

A. Yes.

Q. So at that particular point in time, whatever's identified with respect to those datasets, the number of irrigated acres identified would be relevant, but you can't, necessarily, draw conclusions as to what's happening before or after that particular

snapshot; is that correct?

A. I think that there's evidence that they don't change that much between them, if you look at what I focused on here for Twin Falls Canal Company between 2017 -- or 2011 and 2017. And I think that that's the reason that, for example, in the modeling for, you know, years that we don't have the intervening data, we just use whatever the most recent data is because we have some confidence that the level of difference is not going to be that great.

Q. But, for example, between 2011 and 2017, you don't have an irrigated lands dataset for 2013, do you?

A. I actually think there is, potentially, irrigated lands datasets for every year in between this, based on the information that I saw on a Department information page. But I haven't verified those in the archive, but I think there are additional years to what's shown here.

Q. So for 2013, for example, what irrigated land figure would you utilize? Would you use an unknown number that you haven't calculated for 2013, or would you use the shapefile acres for SWC members and specifically for Twin Falls?

A. I think that the change that you see -- I think that they should be updated relative to each

other. So in my opinion, in 2013, the shapefile that was submitted by SWC should have been verified against the 2011 irrigated lands dataset as well as against the acres identified in the SPF report that were accepted previously in the methodology to confirm that either those acres were still nonirrigated or that they had somehow changed to be irrigated.

Q. But would you agree that, in 2013, the best information available to the Department was the SWC shapefile for Twin Falls Canal Company?

A. No. Because the Department really made it clear that they don't verify the acres that are submitted from the Surface Water Coalition entities to identify nonirrigated acres, and those efforts to identify nonirrigated acres are done in other datasets.

Q. So within the irrigated lands dataset, can you explain to me what the difference is between semi-irrigated and irrigated lands?

A. Semi-irrigated is a classification that, like, a subdivision or a developed area would be classified into. And irrigated are, you know, purely irrigation lands like an agricultural field.

Q. And do you know the time of the year that the irrigated lands dataset was generated, for example, in the spring or in the midsummer? Late fall?

A. I think that they use, you know, a variety of different sources that probably all -- they use satellite imagery, they use aerial imagery, so the dates on all of those are going to vary.

Q. So would you agree that, depending upon the date of a photograph of -- showing irrigated acres, if it was in the early spring, that later in the spring or later in the summer that those particular lines might be irrigated if they previously were shown as not irrigated?

A. I think the point of generating the irrigated lands dataset is specifically to characterize irrigated acres for the consumptive use calculation used in the model. So I think their, you know -- their method is based around trying to capture that as best they can. I don't know the dates or how they make sure that that is true.

Q. So now turning to your testimony on the baseline year, is it fair to say that your -- the issue you draw with utilizing the base year 2018 as the new baseline year under the Fifth Methodology Order was that it was above the average for looking at all years?

A. I think relative to previous baseline years that have been selected in previous orders, it's a higher percentage than have been selected previously.

And my testimony is that it is possible to select something that's more consistent with the baseline year that has been adopted in previous methodologies.

Q. So more consistent with being closer to the average as opposed to more conservative in terms of baseline year demand?

A. Yes, more consistent with the previous percent of average.

Q. So do you have an understanding of why the Department picks a baseline year that's above average?

A. They're trying to give the senior adequate protection.

Q. Protection against what?

A. I think protection that they're going to have the supplies that they need to meet demands in the next coming season.

Q. And do you know why they, the Department or the -- in the Methodology Order -- identify an above-average year as opposed to a below-average year? Is it because of a court determination that requires that?

Do you have a general understanding?

A. I have seen, I think, that language that you're referring to.

Q. You've reviewed that language?

A. I've seen it before. I think it was in one of your expert reports.

Q. Okay. With respect to the baseline year and your testimony regarding looking at 2018 as a baseline year, do you recall your testimony regarding above-average years and the potential for lax operations -- I wrote it down; you used that phrase "lax operations" -- by project managers in terms of delivering water?

Do you recall that testimony?

A. Yes. I think that I was referring to water supply outlooks in 2018 based on the snowpack that occurred in that year. People had confidence, I think, at that time that it wasn't going to be a constrained water supply year, that there would be recharge opportunity.

COURT REPORTER: I'm sorry, can you repeat that last part again.

THE WITNESS: That there would be recharge opportunity.

COURT REPORTER: Thank you.

Q. (BY MR. SIMPSON) How does recharge opportunity relate to project managers delivering their water supply?

A. I don't know that they do.

Q. So I took what you said when you said "lax operations" for the projects, that managers weren't as careful when they deliver water in a year like 2018.

Would that be a correct conclusion?

A. I think I'm just saying that that's possible. I know that I think -- or I think that it's easier to run operations with higher volumes through the system, and if you know that it's not going to be constrained, maybe you would want to have your operations be easier. But I don't know that.

Q. You don't have any evidence that shows that; is that correct?

A. That's correct.

Q. So in your testimony we discussed -- -- strike that.

You discussed the issue of reasonable carryover and how a modification in the baseline year resulted in a change in reasonable carryover for SWC members.

Do you recall that testimony?

A. Yes.

Q. And that that change increased the carryover figures for many of the SWC members; correct?

A. Correct.

Q. Do you have an understanding with respect to

the methodology and the identification of reasonable carryover and what the purpose of reasonable carryover is?

A. I identified that in my report as something that I would like to have given more consideration if I had more time. It's something that I am less familiar with at this time in terms of what all of the considerations around reasonable carryover are, and it's something that was not presented to the technical working group in 2022.

Q. So with respect to the purpose of reasonable carryover, you don't have a clear understanding of why it's identified in the methodology?

A. I mean, I think it's to protect that you have adequate supplies for the next irrigation season. That's the purpose of your reservoirs, are to carry over supplies when you need them.

Q. So the purpose of that carryover figure is to protect the SWC members and to ensure that they have an adequate water supply for the following year?

A. That's my understanding.

Q. And in the context of your testimony regarding bias being built into the reasonable carryover, how does that bias impact the reasonable carryover figure?

A. In my report and in my testimony, I think I'm

being specific to how the selection of the baseline year is affecting reasonable carryover. And so it's kind of just related to the fact that I think, compared to previous baseline year determinations in previous orders, 2018 is a further bias in terms of how it predicts demand needs.

Q. Sophia, with respect to the Methodology Order, would you agree that the purpose of that Methodology Order is to ensure that the injured party receives water when they need it?

A. I think that is a fair statement.

Q. When you were testifying as to forecast supply, you identified some concerns regarding the continued use of Box Canyon as part of the forecasted supply determination in the As-Applied Order for April.

Do you recall that testimony?

A. Yes.

Q. So earlier, Sophia, you testified that you had been involved in the Rangen call, so you have a general understanding of the ESPA and ongoing efforts on the ESPA regarding recharge efforts and other efforts throughout that area?

A. I think so.

Q. So do you have a general understanding that a number of the Water Resource Board's activities with

respect to managed recharge are occurring in the lower valley, that is, diversions occurring below American Falls?

A. I would say most of the Board's recharge is in the lower valley.

Q. And with respect to that recharge that's occurring in the lower valley, do you have an understanding that most of the benefits from that recharge have propagated into the reaches below Milner?

A. I think that that is true.

Q. And could that -- those efforts by the Board influencing the Box Canyon and the issue that you raise with respect to the R-squared values associated with Box Canyon as a reasonable forecast tool?

A. I think that those recharge efforts influence the discharge at Box Canyon.

Q. So if those recharge efforts were leading to the overprediction of the discharge from Box Canyon, could that have an impact on the forecasted supply in April for SWC members?

A. It would be a matter of looking at the timing of that, the timing of when they -- what discharge measurement timing is on the predictor versus the response timing of that recharge to that spring.

Q. And so if you've identified concerns about the

R-squared relationship at Box Canyon and the use of Box Canyon as a part of the forecasted water supply, until a change is made, how would you respond to this uncertainty?

A. I think the Department has responded to that uncertainty, and that's, you know, one of the reasons that they take the standard deviation below in favor of the Surface Water Coalition. They -- any uncertainty they have taken there, that's how they address it.

Q. So with those additional questions that you've raised or uncertainty that you've raised with respect to Box Canyon, would you agree that taking a conservative approach is warranted?

A. I think that's the Department's discretion in terms of how they want to take that approach, and they've chosen a wide margin on how much conservatism or bias that they want to -- that they've applied there. So it's, in my opinion, one standard deviation is very significant in terms of the reduction.

Q. Sophia, if you could turn to page 34 of your report.

A. Would you mind giving me a section header?

Q. Yeah. On page 34 of your report. At the top of that page, you discuss -- or state that: [As read] "the ESPAM transmissivity does not fit the

hydrogeological characteristics of the near Blackfoot to Minidoka reach region."

Do you see that at the top of the page?

A. Is that the paragraph right above Section 3.4.3?

Q. It is.

A. Yeah.

Q. So can you explain to me why that transmissivity does not fit?

A. Sure. So if we look at the Figure 33 -- 3-3 -- and this was something that was criticized or brought to the Department's attention in the Ralston report that was prepared for them, which I think would have been referring to ESPAM1.1, based on the date of that, but I think you can see it has persisted in all of these.

And, essentially, it's that if you just look at where the American Falls Reservoir is positioned in terms of the transmissivity, it's in a pretty high -- so the transmissivity values on these, the darker color, the higher the transmissivity is.

And so you can see that in all of these models kind of in the vicinity of that American Falls reach, it's of those higher transmissivity colors, and the geology, basically, the presence of these interfingering

impermeable units would specify that you should have lower transmissivity in that American Falls area and to the southwest.

And that's, you know, a function of what causes the discharge to that near Blackfoot to Neeley reach to come up before the reservoir. Basically, all the springs are kind of -- to the -- to the east.

Q. And is part of your opinion based upon the fact that we have a single-layer model instead of a multilayer model?

A. Yes. I mean, that's separate from just the comment on the transmissivity. But perhaps the inappropriate -- perhaps that if the model had the multiple layers that it should in that area, the transmissivity would work itself out.

Q. Is it ever appropriate to represent a multilayer geologic system with a single-layer groundwater model?

A. In my professional career, and I've built a lot of models, I've never built a single-layer model, even when I'm doing -- representing an alluvial aquifer system on a short reach of river. Because I was taught that even in just an alluvial environment, the vertical hydraulic conductivity is less than the horizontal hydraulic conductivity, I will have multiple layers so

that I can represent that anisotropy.

Q. Do you know why ESPAM uses a single layer?

A. I've heard the Department talk about maybe they don't have the data to support multiple layers. But, you know, in my review of just kind of the information that's available out there, there's some hydrogeologic studies done for the RASA project, which is Regional Aquifer-System -- I can't remember exactly. But back in the '90s, they had, you know, I think a four-layer model of the Eastern Snake Plain. So it's really at the modeler's discretion.

Q. And is that an issue you bring up in the modeling committee that you're a part of?

A. Yes.

Q. Does the MODFLOW river package allow for the representation of low permeability impacts of fine grain sediments in the area in the Black- -- near Blackfoot to Minidoka area?

A. MODFLOW is capable of representing multiple layers, and you can parameterize those to represent those impermeable characteristics.

In particular, ESPAM2.2 moved to a version of MODFLOW that's called MODFLOW USG, which stands for unstructured grain. And it's very -- it's very flexible, in that it allows you to put in layers in just

certain parts of the aquifer. It doesn't have to be across the whole region.

Q. Right. So the river package can control the interactions of the river and the reservoir?

A. Yes. The river package has a conductance value that, exactly that, is very controlling in terms of how it interacts with the groundwater -- the regional groundwater levels.

Q. So with respect to the near Blackfoot to Minidoka reach, is this how the interactions with respect to reach gains are represented in that area?

A. I mean, the boundary conditions as they're -- as they exist in MODFLOW are implemented throughout the model and including this reach.

Q. Sophia, in your testimony you discussed confidence in ESPAM2.2 predictions in the near Blackfoot to Minidoka reach gain, and you make comparisons between ESPAM2.1 and 2.2 --

A. Yes.

Q. -- I believe specifically stating that those differences in reach gain predictions indicate uncertainty in the model.

Is that your testimony?

A. Yes. I think they're a reflection of uncertainty that we have in aquifer parameters and water

budget components.

Q. But aren't those differences due primarily to improvements in 2.2 from 2.1 that more accurately calculate reach gains?

A. I think that there are localized improvements that were done in ESPAM2.2, so I think that's true. But I don't think that -- I don't think that that is -- I think it's separate from just kind of general model uncertainty that we have in prediction from these other components; like model -- like conceptual uncertainty and input parameter uncertainty, they still exist.

Q. Would you agree that we're going to always have some level of uncertainty when we're dealing with a model?

A. I agree with that. What I'm highlighting in my report here is very specific issues around water budget components for consumptive use and a known problem that will impact the response to this reach in a similar fashion that was, you know, a change that we saw from 2.1 to 2.2.

Q. So do you have a recommendation for a better way to estimate near Blackfoot to Minidoka reach gains?

A. I think my recommendation, which is, you know, something that the Department puts in their calibration report, is that because we have this model uncertainty,

that uncertainty should be taken into account when using it in water resource applications and administration.

And so I think in my report I'm advocating to consider a trim line as a potential -- a potential to just recognize that there is uncertainty in some of the -- in the prediction that we're making.

Q. So you've used this term "trim line." What's your definition of a trim line?

A. I think in applications that I'm familiar with, it's often based on a response to the reach or a feature. Like, I think in Rangen, they used the Great Rift where the response beyond that feature they have less certainty in.

Q. So with respect to the application of a trim line, do you think that junior groundwater pumpers are responsible for mitigating their impacts to senior surface water rights?

MS. PATTERSON: Object. Objection. This is outside the scope of her report, and it calls for --

HEARING OFFICER: Am I hearing an objection?

MS. PATTERSON: Yes. Objection. Sorry.

HEARING OFFICER: You'll need to speak up loudly, I think.

MS. PATTERSON: It's outside the scope of her report, and it calls for a legal conclusion.

MR. SIMPSON: Well, Mr. Director, she's testifying as to her perspective or her testimony regarding the application of a trim line, and that's what my question was based upon.

HEARING OFFICER: Overruled.

Answer the question, please, Ms. Sigstedt.

THE WITNESS: Can you repeat the question.

Q. (BY MR. SIMPSON) You testified a few moments ago about the application of a trim line, and my question that I asked you was: Do you believe that junior groundwater pumpers are responsible for mitigating their impacts to senior surface water rights?

A. I think that water users are, you know, ruled by state administration's rules.

Q. So if it's determined that junior groundwater pumping is impacting a senior surface water right, then they would have the obligation to mitigate for that impact?

A. I mean, however that's determined. Like I said, a trim line has been used with the ESPAM model in previous rulings and, you know, however that's applied or not applied is what the obligation is.

MR. SIMPSON: That's all the questions I have.

HEARING OFFICER: Did you have further cross-examination, Mr. Fletcher?

MR. FLETCHER: Yes, I have just two lines of TJ's version of 30 minutes from yesterday, if that's okay, unless you want to break right now.

HEARING OFFICER: What does everybody want to do? I'm sure we'll have some redirect.

MS. PATTERSON: We will have some redirect, but we're happy to have Kent do this questioning.

HEARING OFFICER: I just wonder whether we can get through Ms. Sigstedt before lunch. My guess is we will end up with a late lunch.

Let's break right now and come back a quarter after and you may ask your questions then, Mr. Fletcher.

So let's break for lunch and come back in an hour, at a quarter after 1:00. Thank you.

(Break taken.)

HEARING OFFICER: We're recording again after the lunch recess.

Mr. Fletcher, you may cross-examine Ms. Sigstedt.

MR. FLETCHER: Ms. Sigstedt, are you on the phone?

HEARING OFFICER: Perhaps she's not.

MR. FLETCHER: Unless the name's changed.

THE WITNESS: Can you hear me? Can you hear me?

MR. FLETCHER: There you are.

HEARING OFFICER: There you are.

CROSS-EXAMINATION

QUESTIONS BY MR. FLETCHER:

Q. Good afternoon. My name is Kent Fletcher. I represent Minidoka Irrigation District and American Falls Reservoir District 2, and I just have two areas I'd like to ask you a few questions concerning.

And the first one is, in this proceeding, there's been a lot of discussion about the number of acres of the SWC members and how they're calculated and that, as I understand your report, you believe the number of acres in the methodology are overstated for Twin Falls Canal Company; isn't that correct?

A. That's correct.

Q. But one thing that hasn't been discussed at all is if the number of acres are changed, don't other changes have to be made to the methodology?

How does the change in the number of acres affect the methodology?

A. It's used in the calculation of crop water need.

Q. Where else is it used?

A. That's the main thing that I can think about.

Q. Is it used in the determination of project efficiency?

A. I think project efficiency is calculated using crop water need and the diversions, so I think the change to crop water need affects the project efficiency calculation.

Q. And the crop water need is based upon acreage, correct, to some degree?

A. Correct.

Q. So if you went back -- if you change the number of acres, you'd have to recalculate the efficiency of the entity; correct?

A. So in my report, I'm changing the value of the acres using the Department's reasonable in-season demand sheet. And I believe I can see it changing the calculation of the project efficiency in there. So in the example I provide, I think that is taken care of, unless I'm missing something.

Q. Well, you said that the use of a different -- of the higher acres number creates what you referred to as an erroneous shortfall; correct?

A. Correct.

Q. But if you adjusted efficiency to take into account the adjustment in acres and the same amount of water was diverted, the shortfall would be the same;

isn't that correct?

A. I mean, it doesn't seem so. I do see the project efficiencies go down when I change the irrigated acres, but I'm still calculating a difference in the shortfall.

Q. How much would it adjust the shortfall?

A. We can look at my table. So if you look at page 27 of Exhibit 387, I have recalculated the shortfall changing the irrigated acres for Twin Falls Canal Company in the reasonable in-season demand calculation sheet, which, like I said, it seems to be changing the project efficiency. And those are the shortfalls, the difference.

Q. Did you recalculate the efficiency as part of that?

A. Like I said, to me, they seem to be updating in the sheet as a function of the crop water need, so I do see a change in the project efficiency.

Q. So that was really the point I was trying to make. It is true that if you do redo the acres, you have to adjust the project efficiency as well as the crop water need; correct?

A. That's how the calculation sheet works, to my understanding.

Q. The other area I would like to go into dealt

with the transient versus steady state analysis. I'm a little unclear on what your opinion is concerning the use of the steady state.

I believe your testimony when Mr. Simpson was questioning you was that the transient model run was the only way to determine how much water would be available in the reach during the year of need. Wasn't that correct?

Isn't that your testimony?

A. If you're trying to determine the amount of water May through September of the current year, the transient model is the only model that can give you that answer.

Q. So if your goal is to furnish the amount of shortage to the injured party during that year, you have to use the transient model; correct?

A. That's the way to get that model output.

Q. And if you use the steady state model run to do the same calculation, the injured party would only receive about 15 percent of the shortfall in that year; isn't that correct?

A. I think it varies by curtailment date in terms of the percentage.

Q. Well, you reviewed Jennifer Sukow's information; correct?

A. Correct.
Q. And do you remember the information that she provided? I think it said that either 15 percent or 9 to 15 percent appears in the year of curtailment?
A. Yes, that range is what I'm referring to --
Q. Okay.
A. -- that the --
COURT REPORTER: Ms. Sigstedt, I'm sorry. I missed some of that again. I got, "Yes, that range is what I'm referring to"?
THE WITNESS: I think that that range was developed based on analyzing different curtailment dates and looking at the comparison of the transient -- the in-season to the steady state response.
Q. (BY MR. FLETCHER) Do you believe that the goal of the methodology should be to protect seniors from injury caused by junior diversions?
A. I think that that sounds correct.
Q. And do you agree that if injury is determined, the shortfall should be supplied in time, location, and amount that season?
A. To me, that seems like, potentially, a policy decision. I don't know if it's a technical question.
Q. So you don't have an opinion on that?
A. My opinion is that it's a policy decision.

MR. FLETCHER: Thank you.

I don't have any further questions.

HEARING OFFICER: Okay. Thank you, Mr. Fletcher.

Redirect, Ms. Patterson?

MS. PATTERSON: Yes. Just a moment.

HEARING OFFICER: Do you want to go off the record?

MS. PATTERSON: No. I'll be short.

REDIRECT EXAMINATION

QUESTIONS BY MS. PATTERSON:

Q. Hi, Sophia. Before lunch, you were asked by Mr. Simpson whether or not you were saying the model should be used given the uncertainty, and I think you replied that it's what we have, and so, yes, it should be used.

I just want to clarify, are you saying that it can be used but you need to account for the uncertainty?

A. That's correct.

Q. And then there was questions about irrigated acres and whether or not in 2013 the Department should have used the self-reported numbers.

You commented that, no, that one shouldn't be used because it hasn't been verified; is that correct?

A. That's correct.
Q. Could you envision a process such as the Department using the most recent data available for irrigated acres, such as the Landsat data that they use in the model, and then the districts, if they find an error with that, could produce that -- produce that evidence to the Department if they want to contend that the data, the Landsat data excludes irrigated or semi-irrigated acres?
A. Yes, I think that makes sense, and I also think that in the application of those acres, there is the semi-irrigated acres category that I think is just being treated as irrigated acres. I think, similarly, you can make a determination of the percent of the semi-irrigated acres that are nonirrigated.
Q. Thank you.
That brings me to my last question which is, again, related to the Landsat data. That includes irrigated, semi-irrigated, and nonirrigated acres; is that correct?
A. That's correct.
Q. And if we look at --
A. The irrigated lands dataset is the one that has those classifications.
Q. Thank you, the irrigated lands dataset.

Going to Table 2-3, where it discusses the different ways to calculate irrigated acres, in that chart do you know whether that -- those numbers include both irrigated acres and semi-irrigated, or is it only counting irrigated?

A. I'm pretty sure, from the testimony that we heard from Matt, it is including the semi-irrigated.

Q. Okay. That is what I recall as well. Thank you.

MS. PATTERSON: That's all.

HEARING OFFICER: Recross, Mr. Simpson?

MR. SIMPSON: No.

HEARING OFFICER: Mr. Fletcher?

MR. FLETCHER: No.

HEARING OFFICER: I just have one question for Ms. Sigstedt.

EXAMINATION

QUESTIONS BY THE HEARING OFFICER:

Q. Ms. Sigstedt, I am looking at page 23 under Section 2.2.2, and the beginning of the second paragraph, it says: "The first is that Box Canyon spring flows are representative of groundwater discharge to the near Blackfoot to Minidoka reach."

Is that your testimony?

A. No, that looks like a typo. It should be "are not representative."

Q. Okay. And it may be just in the context of that statement, because in the previous paragraph it says: "I have additional concerns about two of the predictions," but then, again, it very clearly states that they are representative, and you're saying that it should say "is not"; is that correct?

A. That's correct.

Q. Okay.

A. I also noticed a typo on the curtailment date under the figure -- under the last figure also. So I think there could be some minor corrections.

Q. Under what figure?

Well, if you don't recall, maybe you can correct it through your counsel. I just noticed this particular sentence and thought it was not consistent with your testimony, and I wanted to ensure that at least the document reflected and was consistent with your testimony.

A. I really appreciate that.

And the other one is Figure 10. 3-10 has a typo in the curtailment date.

MS. PATTERSON: Counsel will see to it that those changes are updated and it's submitted to the

Department.

HEARING OFFICER: You'll have to speak up, Ms. Patterson.

MS. PATTERSON: Counsel will work with Sophia to make sure those corrections are accounted for and submitted to the parties in the Department.

HEARING OFFICER: Okay.

All right. Thank you, Ms. Sigstedt.

THE WITNESS: Thank you.

HEARING OFFICER: The next witness I have in my list is Jaxon Higgs. He is not here, I assume, and doesn't have connections in some remote location in Mexico, Mr. Budge?

MR. BUDGE: That's correct.

HEARING OFFICER: So we don't anticipate hearing from Mr. Higgs.

MR. BUDGE: No.

HEARING OFFICER: And the next witness I show is Bryce Contor.

MR. BUDGE: I think we're going to put Lynn Carlquist on next.

HEARING OFFICER: Okay. Mr. Carlquist, if you'll come forward, please.

THE WITNESS: Right here.

HEARING OFFICER: We'll switch back to our

regular configuration which you have not observed.

Will you raise your right hand, please.

RICHARD LYNN CARLQUIST,

called by IGWA, having been first duly sworn to tell the truth relating to said cause, testified as follows:

HEARING OFFICER: Thank you. This chair may feel comfortable to you, given your long history.

THE WITNESS: Not our first go-round.

HEARING OFFICER: Okay. Mr. Budge.

DIRECT EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Thank you.

Lynn, thank you for being here today. Just to begin, will you please state your name and address for the record.

A. Richard Lynn Carlquist, 1092 South 2500 East, Hazelton, Idaho 83335.

Q. You're here to testify today, Lynn, on behalf of Idaho Ground Water Appropriators?

A. Yes.

Q. What's your current position with IGWA?

A. I am the co-chair of IGWA organization,

serving with Stephanie Mickelsen as the other co-chair.

Q. How long have you been involved with IGWA?

A. Since the mid-2000s. 2005 our groundwater district joined.

Q. And can you identify who IGWA's groundwater district members are?

A. Yeah, if I look them up, I could go -- try and go through them, but there's nine districts and one irrigation district that is members of IGWA.

Q. I'll make it easy for you, Lynn. I'll just go through them and then have you confirm.

There is North Snake Groundwater District, Carey Valley Groundwater District, Magic Valley Ground Water District, Aberdeen-American Falls Groundwater District, Bingham Groundwater District, Jefferson Clark Groundwater District, Henry's Fork Groundwater District, and Madison Groundwater District.

Does that sound right?

A. That sounds right. I think that's all of them.

Q. And Southwest Irrigation District is also a member of IGWA?

A. Yes.

Q. I understand you are a member, personally, of North Snake Groundwater District?

A. That's correct.
Q. How long have you been a member of that district?
A. Since its inception.
Q. Do you serve as a director of that district?
A. Yes.
Q. And as the chairman?
A. Yes.
Q. How long have you been the chairman?
A. Ten years.
Q. Where is North Snake Groundwater District located?
A. It's located in Jerome County, Gooding County, and Blaine -- or Shoshone County.
Q. And it represents groundwater irrigators in that area?
A. Yes.
Q. Are there also nonirrigator members of the district?
A. Yes.
Q. Just describe some of the nonirrigation uses that are in the district.
A. Some of the cheese-processing plants are some of the bigger users of water. Amalgamated Sugar has some use of water. Other cities, municipalities have

water rights that belong to our district.

Q. And I understand there's a lot of dairy operators in your district as well?

A. There are a lot.

Q. How many acres, approximately, are irrigated by members of your district?

A. There's a little over 200,000, 202,000 acres, irrigated acres in our district -- or 102,000 irrigated acres in our district.

Q. Okay. And, generally, what types of crops are grown in your district?

A. Well, the big crops now are alfalfa, corn. There are still potatoes, sugar beets, beans, small grains. Some specialty crops are grown, some seed crops.

Q. And how much water do patrons of your district divert on a per-acre basis typically?

A. The diversion now, we average about -- from our -- the groundwater is 2.2 acre-feet a year.

Q. And I understand that your district limits how much groundwater the patrons are permitted to divert?

A. Yes.

When the Surface Water Coalition plan was formulated and put into place, each groundwater district was given an amount of reduction that belonged to their

district; and we set up a system whereby a set of priorities each individual water right was given a set amount that they could divert.

Q. And that's 2.2 acre-feet in your district?

A. The priorities range from 2.4 to 2. And we average, roughly, that 2.2 right now.

Q. Okay. So more senior rights in your district are allotted a higher volume than more junior rights?

A. That's correct.

Q. And your district sends out to each patron the volume of water it's allowed to use, and they're responsible to stay within that amount?

A. Yes.

Q. Are you aware of other groundwater districts also imposing diversion limits on their members?

A. Yes.

Q. Compared to other groundwater districts, are North Snake's diversion limits higher or lower than others?

A. Generally higher.

Q. The other districts have lower diversion limits than your district?

A. Yes.

Q. I understand you, personally, own groundwater rights in the district?

A. Yes.
Q. And you also own surface water rights?
A. Yes.
Q. Where does your surface water come from?
A. I have surface water rights with A&B Irrigation District, North Side Canal.
Q. Does A&B Irrigation District regulate how much water you can divert under your surface water rights?
A. Yes.
Q. How does that work?
A. We're given so many acre-feet a year that we can pump. If we go beyond that, then we get charged a surcharge for the additional acre-feet that we pump.
Q. Okay. Does North Side Canal Company regulate how much surface water you can divert?
A. Their water right is based on a diversion rate, not a consumptive amount.
Q. So you're just able to divert your rate all season long?
A. Yes, if you want to, you can.
Q. Okay. Let me ask you some questions about the Fifth Methodology Order that was issued April 21st of this year.
Lynn, are you aware that among other changes to the Fifth Methodology Order, the Director changed

from a steady state to a transient state application of the ESPA model?

A. Yes, I'm aware of that.

Q. Did you know what effect a transient state would have on curtailments?

A. Well, we talked about it a lot. We didn't know exactly the impact that it would have, but we knew it would be a major change from the steady state analysis that had been done. And we thought for sure, based on where our groundwater district is, there would be less of an impact; but, in fact, you know, it -- the curtailment for our district is about the same as everybody else.

Q. You're aware that also in April this year the Director issued what we call an As-Applied Order that sets a curtailment date of December 30th, 1953?

A. Yes.

Q. Did you anticipate a curtailment happening this year?

A. No.

Q. Why not?

A. With the larger than average snowpack that we had and what we'd had in previous years, we did not anticipate that there would be a curtailment order issued.

Q. So it came as a surprise to members of your district when the curtailment was issued?
A. Yes.
Q. And have your patrons complained about that revelation?
A. Complained? They've asked questions. They want to know why and what they can do and what the impact will be.
Q. Your patrons also weren't anticipating a curtailment this year?
A. I don't think so.
Q. Lynn, let me have you turn, in one of those white binders behind you, to Exhibit 829.
Do you recognize that document, Lynn?
A. Yes, I've seen this.
MR. BUDGE: And just for the record, I'll represent that Exhibit 829 is a duplication of Figure 3-1 in the expert report of Sophia Sigstedt, which has been admitted into evidence as Exhibit 837.
Q. (BY MR. BUDGE) Lynn, you mentioned that you've seen this before. What do you understand this exhibit shows?
A. Well, in the left portion of the exhibit, it shows IGWA's -- IDWR's percentage of IGWA's proportionate share, and that was based more on a type

of steady state type of analysis, is my understanding.

And the midsection shows the impact of water that would be made available under curtailment based on the transient state analysis.

Q. So if we look at the row for North Snake, that's North Snake Groundwater District; correct?

A. Yes. We're on the very bottom.

Q. If we look at the middle section of that spreadsheet, it shows that the curtailment would eliminate beneficial use of 217,151 acre-feet.

Do you see that?

A. Yes.

Q. Do you understand that to be the curtailment within your district?

A. Based on the December 30th, 1953, date?

Q. Correct. And then the model benefit to the Coalition from May to September would be 0.06 acre-feet?

A. Yes.

Q. Did that come as a surprise to you?

A. Yes. It's much lower than I thought it would have been.

Q. And does this change how North Snake handles groundwater management for its patrons going forward?

A. Well, it probably will. I've had patrons call, and, of course, they have rights junior to 1953.

And if you look over further, it shows that 88,000 acres are junior to that, so they're concerned "Are we going to be curtailed?" And I -- under the way we used to mitigate for an order, was supplying wet water prior to the Surface Water Coalition call -- or agreement that we entered into. And I told them we will be able to supply the necessary water to meet our obligation under this curtailment order.

Q. Which would be a very small fraction?

A. A very small -- less than 1 acre-foot.

Q. Have your patrons continued to conserve water this year -- or I should rephrase that.

Has your district continued to send out the diversion reduction obligations this year like you've done in the past?

A. We have. And at our annual meeting, I told them that we were going to do that, and we asked if everyone was okay with that, that was at the meeting, and they said yes. And we will continue to do our reductions that we've been doing in the past under the Surface Water Coalition Act.

Q. Okay. And that's intended to stabilize the aquifer in your area?

A. That's what our intent is.

Q. It's not, necessarily, a representation of

your obligations under the -- this table that we've just seen?

A. No.

MR. BUDGE: No further questions.

HEARING OFFICER: Okay. Cross-examination? Mr. Simpson or Fletcher?

CROSS-EXAMINATION

QUESTIONS BY MR. FLETCHER:

Q. Hi, Mr. Carlquist. How are you doing?

A. Oh, pretty good.

Q. I'm Kent Fletcher, as you know. We've dealt with each other for many years. And on behalf of our clients, I'd like to thank your district for the actions you've taken over the years pursuant to our plan.

I -- first of all, you mentioned briefly some of the operations for your district. You heard the testimony of Jay Barlogi yesterday -- were you sitting in on that?

A. I was not, I didn't hear it.

Q. I'll represent to you that he said that Twin Falls Canal Company employs -- his written testimony states that the Twin Falls Canal Company employs somewhere around 65 employees, 24 ditch riders to monitor water deliveries. And that's for somewhere

between 180-, 195,000 acres, whatever number is determined. You said you had about 100,000 acres of groundwater that you manage in your groundwater district; correct?

A. I would say we don't manage it, but we have initiated programs for the members of our district who have those groundwater rights. We don't own any groundwater rights as a groundwater district, and I wouldn't say that we manage it, but we give them plans and operations that will help meet the obligations that come because of water calls.

Q. Does your district monitor in-season diversions of groundwater?

A. No.

Q. Does your district take any action against groundwater users who overdivert the allocation you talked about?

A. We do.

Q. And what do you do?

A. We have gone to the program where they are required to pay $100 per acre-foot. There is actually an averaging system that is set up, that Jaxon Higgs helped us put into place, where they can make up in a following year for overages in a previous year. But if after a three-year period of time they don't make it up,

then they have to pay the difference in acre-feet, $100 per acre-foot.

Q. And the only reporting concerning the diversions that take place in your district occurs after the season has ended; is that correct?

A. That's correct.

Q. I was a little confused about your actions.

Is your district -- you mentioned the 2015 agreement a few times. Is your district still honoring the 2015 mitigation plan and the order that was entered pursuant to that?

MR. BUDGE: Objection. Beyond the scope of this proceeding.

HEARING OFFICER: I don't -- I don't think so. He testified about the actions that were taken by North Snake. This is clarification.

MR. FLETCHER: Right.

HEARING OFFICER: Overruled.

MR. BUDGE: Objection. Calls for a legal conclusion.

HEARING OFFICER: Overruled again.

MR. BUDGE: Mr. Director, can I inquire of the witness in aid of objection?

HEARING OFFICER: Sure.

MR. BUDGE: And I'll just stand here.

Mr. Carlquist, do you understand that the dispute has arisen between IGWA and the Surface Water Coalition over the terms of the 2015 settlement agreement?

THE WITNESS: Now, say that again.

MR. BUDGE: Do you understand that a dispute has arisen between IGWA and the Surface Water Coalition over the terms of the 2015 settlement agreement?

THE WITNESS: Yes.

MR. BUDGE: Do you understand that dispute is presently on appeal?

THE WITNESS: Yes.

MR. BUDGE: That dispute has not finally been resolved?

THE WITNESS: That's my understanding.

MR. BUDGE: And your understanding of the terms of that agreement are different than the Surface Water Coalition's understanding of the terms of that agreement?

THE WITNESS: That has been the case.

MR. BUDGE: Mr. Director, Mr. Fletcher is asking the witness to testify as to whether he's in compliance with the agreement. The witness can't do that, given that the terms of the agreement have not fully been adjudicated.

HEARING OFFICER: Mr. Carlquist can testify about whether he believes he's complying or not. Overruled.

Mr. Fletcher.

MR. FLETCHER: Let me reask the question because that wasn't my question, and I'm not looking for past breaches or these issues that Mr. Budge is talking about.

Q. (BY MR. FLETCHER) What I'm talking about is this year, 2023, is your district planning on attempting to comply with the 2015 settlement agreement and the order that was entered?

A. That had been the case that we were going to try and do. What was frustrating was the fact that we found out that even if we do it, if other members of the IGWA don't comply, then we're also out of compliance, so we don't know where we're going to go.

Q. So that's your understanding is that your district could comply, but if your -- if other districts don't, then all of you will be out of compliance?

A. That's my understanding.

Q. So you're not sure if you're going to attempt to comply with that yet, as I understand it?

A. At our annual meeting, I made the suggestion to the members of our district that we would still do

our share of compliance of that agreement, and our plan was to do that; but if doing that will not bring us any satisfaction, then I'm not sure what direction we'll go now.

Q. I understand that.

Is it your belief that if you do comply with the mitigation plan and are found to be in compliance with the mitigation plan, that your district then would have safe harbor?

A. No. My understanding is we will not.

Q. No, I say if you were in compliance with the mitigation plan, if you believed you were, and if the Director found you were in compliance with the mitigation plan, your district, then you would have safe harbor?

A. I don't know that we would. I don't think anyone's told us that we can do it individually and receive safe harbor.

Q. If you did have -- if you were found to be complying with the mitigation plan and order that is in place now, you would have safe harbor?

MR. BUDGE: Objection. Director, I'm going to renew my objection. This case is involving the Fifth Methodology Order and the As-Applied Order. We have a separate proceeding involving the mitigation plan past

compliance and mitigation compliance for 2023, and I don't think it's appropriate in this proceeding for Mr. Fletcher to ask the questions that he would like to have answers to in other proceedings.

HEARING OFFICER: And, Mr. Budge, your direct examination opened up this particular subject. Mr. Fletcher is exploring it. Overruled.

Q. (BY MR. FLETCHER) Do you remember my question?

A. Do it again.

Q. All right. If you were found to be in compliance with the mitigation plan this year, then the mitigation plan states you would have safe harbor; correct?

A. Well, the agreement says we would have safe harbor, but my understanding is from decisions that have come from the Department, from the Director, is the fact that if everyone is not in compliance, then no one is going to be in compliance.

Q. And if you had safe harbor, then none of your irrigators would be subject to curtailment regardless of what the curtailment date is; correct?

A. That's correct.

Q. You brought up this table -- or your counsel brought up this table that Jaxon Higgs prepared. I

think you still have it in front of you; is that correct?

A. I do.

Q. I was a little unclear about your testimony on that. It does show that in a one-year transient state analysis that North Snake would have to contribute a very small amount of water?

A. Yes.

Q. Is that correct?

A. That's correct.

Q. Are you -- is it your position as president of IGWA that those who contribute more to the shortage this year should mitigate for that, and those who contribute less mitigate their share?

A. That decision has not been made by IGWA.

Q. Is that your position as the president of your groundwater district?

A. No, it's not.

Q. What is your position concerning a mitigation requirement for this year?

A. We, as a group of groundwater districts, would have to get together and determine how any obligation would be shared. And that hasn't been done yet.

Q. So it has not been done yet?

A. No.

MR. FLETCHER: That's all the questions I have. Thank you, Mr. Carlquist.

HEARING OFFICER: Any further cross?

Mr. Simpson?

CROSS-EXAMINATION

QUESTIONS BY MR. SIMPSON:

Q. Lynn, good afternoon. John Simpson representing A&B, et al. Good to see you again. I just had a couple follow-ups to your direct testimony.

First, you indicated on direct that you thought since it was a good snowpack, that there wouldn't be a curtailment this year; is that fair?

A. That would be -- that was my thought, that the snowpacks were large enough, you know, and, of course, I was surprised when I understood that the -- those who measure said that possibly the system would not totally fill, even with the snowpack that we had, because there were certain areas, Jackson Lake area, for example, didn't have quite the snow that other areas did.

Q. Yeah. And given that you receive North Side Canal Company water; correct?

A. Yes.

Q. As the reservoir system declines in its carryover, that, obviously, means you need a better

snowpack in order to fill the reservoirs; correct?
A. Yes.
Q. And so that's part of the reason why --
A. It also depends on how the water comes off of that system up there to fill the reservoir.
Q. You bet. Understand that.
So in your experience, even if you have a good snowpack, it doesn't necessarily ensure that surface water users have a full water supply; is that fair?
A. You can't guarantee it, but it's certainly a better chance, we thought, that they would have a full water supply on a year like this.
Q. And so with respect to your groundwater rights and your pumps and where those pumps are on the North Snake groundwater system, what have you observed in terms of your groundwater levels over the last couple years?
A. In the last couple years, they've gone back down. In the prior 10 or 12 years, they've come up fairly dramatically. And then the last two years, they've declined a little bit again.
Q. When you say "a little bit," 10 feet? 15 feet?
A. 3 feet.
Q. So in those prior years since 2015, what kind

of increase did you see?

A. We went up almost 12 feet. And that's the first time they've gone up since the '80s.

Q. So you saw about a 25 percent decline over the last couple years?

A. Yes.

Q. So when you were asked on direct testimony that you're anticipating to continue your reductions in order to stabilize the aquifer -- do you recall that testimony?

A. Yes.

Q. So when you --

A. When we -- we, as a board of North Snake Groundwater District, have made that determination, and we have expressed that desire to the members of our district and received their --

Q. Approval?

A. -- "yea" that they would be fine with that.

Q. So when you talk about stabilizing, what does that mean to you in terms of your North Snake members in the district?

A. Our idea is that we will not see further declines going down. Not that we'll recover it to a particular level, but they will not continue to decline.

Q. Not continue the declines that we've seen in

the last couple years?

A. No. Decline in the last 20 years.

Q. Then looking at this table that Jaxon Higgs put together that you have in front of you, you indicated that the first couple columns were a steady state calculation?

A. That was my understanding, that we requested from the Department that they give us -- the allocation of the amount of this order would be for the districts. And my understanding was that the numbers that are there in the first columns, like, for example, North Snake would be 3,262 acre-feet, was done on some -- whether it's a modified steady state analysis or what, but it wasn't done on the straight transient analysis.

Q. So is it fair to say that, in the first column where it says 5.1 percent, that's -- North Snake's obligation under a steady state modeling was 5.1 percent?

A. That's my understanding.

Q. So that would be 5.1 percent of the obligation that would be owed to the Surface Water Coalition?

A. Yes.

Q. Under a steady state analysis, to be fair?

A. Yes.

Q. And with respect to your -- not "your," but

the North Snake groundwater rights within the groundwater district, have most, if not all, of those groundwater rights been in place for -- since 1993, the date of the moratorium; do you know?

A. Most, I would say, most have been in place since then.

Q. A very high percentage?

A. Yes, a high percentage.

MR. SIMPSON: That's all the questions I have. Thank you.

HEARING OFFICER: Okay. Mr. Budge, redirect.

REDIRECT EXAMINATION

QUESTIONS BY MR. BUDGE:

Q. Yeah, just a few follow-up questions, Lynn.

Mr. Simpson was asking you some questions about the snowpack this last winter?

A. [Witness nods head.]

Q. And you understand it was well above average snowpack this winter in the Upper Snake River Basin?

A. Well, it was above average. Now, well above average, I'm not sure what that number means, but at times we were up close to 150 percent of average. And in certain parts of it, it was above that.

Q. And in years past when we had that much snow

in the mountains, there would not have been a curtailment under the Methodology Order; correct?

A. Not that I remember.

Q. Okay. And do you understand that under the Fourth Methodology Order, there would not have been a curtailment this year?

A. I don't know that for sure.

Q. Okay. But you did understand or did assume that with as much snow as we've got, you did not expect a curtailment coming this year?

A. I did not expect a curtailment coming this year.

Q. Let me ask you a few questions about that table in front of you, which is Exhibit 829, the table that Jaxon Higgs prepared.

Mr. Fletcher asked you some questions about how mitigation obligations are apportioned among the groundwater districts under the 2015 settlement agreement.

Do you recall that?

A. Yes.

Q. You understand that the terms of that agreement do not specify how that 240,000-acre-foot obligation is apportioned among the districts?

MR. FLETCHER: Director, I'm going to object

simply because I didn't ask that question, but I don't mind this line of inquiry. I mean, I don't know how to do that. That was not my question to Mr. Carlquist.

MR. BUDGE: I'll accept the withdrawal of objection.

MR. FLETCHER: I'm objecting to the fact that I asked about that. I did not.

HEARING OFFICER: All right.

MR. FLETCHER: It misstates the foundation for the question.

HEARING OFFICER: All right. So, Mr. Carlquist, if you remember the question, you may answer. Otherwise, Mr. Budge, please restate the question.

THE WITNESS: Well, I think I remember, but go ahead and restate it.

Q. (BY MR. BUDGE) Do you recall Mr. Fletcher discussing with you for a moment the 2015 settlement agreement between IGWA and the Surface Water Coalition?

A. Broadly, I guess, yeah.

Q. And he was asking if your district's planning to comply with that this year?

A. Yes.

Q. You understand that one of the terms of that agreement is that the groundwater districts

collectively -- or the groundwater users collectively will conserve 240,000 acre-feet of water?

A. Yes.

Q. And you understand that the agreement does not specify how much conservation each individual groundwater district has to achieve?

A. I don't think the agreement says that, but the groundwater districts apportion their share of the 240,000 acre-feet based on their share of pumping, their historical baseline pumping that they had had the previous five years.

Q. And that apportionment was an agreement that the groundwater districts struck among themselves after the 2015 settlement agreement was signed?

A. Yes.

Q. And you understand the Director recently changed or interpreted the terms of that agreement in a way that would collectively require the groundwater districts to conserve more water than they had historically?

A. More than we have historically, yes. When the allocation -- when we did the allocation among the groundwater districts, we assumed that everyone who pumps water would have some share of that 240,000 acre-feet. So the districts that were -- signed

the agreement -- the six districts that signed the agreement, allocated 202,000 of the 240,000 acre-feet.

Q. 205,000?

A. Yeah, it was 202 or 205, yeah.

Q. And now that the Director's come out with the new transient state model application, does that change your thinking on how the 240 should be allocated?

A. Well, that's possible. We'll have to negotiate like we did before with the groundwater districts, but our district has decided that we are going to maintain our reduction proportion that we've had in the past, which is based on the 205, not the 240. That's what -- that's the allocation that we send out. Pumping allocation to the members of our district is based on our share of the 205,000 acre-feet.

Q. Yeah. Is it fair to say that the information in that table that shows the transient state impacts, that the districts have discussed how to reallocate the 240 and not been able to reach an agreement?

A. No. No agreement has been reached.

MR. BUDGE: The last thing I would do, Director, and this is just really for clarity of the record, is, I've been referring to Exhibit 829, which is that table from an excerpt from Exhibit 837. I would move that we admit that as a separate of exhibit just

for ease of reference in the record.

HEARING OFFICER: Any objection?

MR. FLETCHER: We have no objection. It was already admitted as part of Sophia's expert report.

HEARING OFFICER: The document, then, that has been marked as Exhibit 829 is received into evidence.

(Exhibit 829 received.)

MR. BUDGE: Thank you, Lynn.

HEARING OFFICER: Any further cross-examination?

MR. FLETCHER: I don't have anything further.

MR. SIMPSON: No.

HEARING OFFICER: Thank you, Mr. Carlquist.

Now, my list of witnesses, I don't know where to go. Please direct me.

MR. JOHNS: I think we're going to have Bryce Contor go up next, if that's permissible.

HEARING OFFICER: All right. Mr. Contor, if you'll come forward, please.

MR. JOHNS: Do you care if I --

HEARING OFFICER: You can sit or stand if you want.

Will you raise your right hand.

///

///

BRYCE CONTOR,

called by Bonneville-Jefferson Ground Water District, having been first duly sworn to tell the truth relating to said cause, testified as follows:

HEARING OFFICER: Thank you. Please be seated.

Mr. Johns?

DIRECT EXAMINATION

QUESTIONS BY MR. JOHNS:

Q. Good afternoon, Mr. Contor. For the record, my name is Skyler Johns, and I represent Bonneville-Jefferson Ground Water District in this matter.

Can you please state your name and spell it for the record.

A. Bryce Contor, B-r-y-c-e, C-o-n-t-o-r.

Q. And just to check, are you okay if I call you Bryce?

A. Yes, sir.

Q. Perfect. The parties have stipulated to your qualifications as an expert; however, would you just briefly describe your educational background for us?

A. I've got an associate degree in farm crops

management. I've got a bachelor's degree in agricultural economics, a master's degree in hydrology from the University of Idaho.

Q. Can you, please, also describe your work history on water issues.

A. Yeah. So I farmed, I irrigated with groundwater and surface water, I served on the canal board. As a member of the canal board, I prepared the -- our little tiny canal company's adjudication claims.

I later went to work for Idaho Department of Water Resources, first measuring discharge wells in the Magic Valley and then in the Mud Lake area and also west of Idaho Falls.

After that I worked for Idaho Department of Water Resources making adjudication recommendations in the Snake River Basin Adjudication.

I went to work as a hydrologist for the University of Idaho doing the water budgets for the ESPAM models from 2001 through about 2010. During that time, I did subcontract work under Water District 1 doing field examinations for Snake River Basin Adjudication claims.

And then in 2010, I transitioned to the private sector. I've done water rights work, landfill

work, flow measurement work, all related to water resources.

Q. Okay. And are you still in the private sector?

A. Yes.

Q. Who's your employer?

A. Rocky Mountain Environmental Associates is the company. In this matter, Rocky Mountain is employed by the Bonneville-Jefferson Ground Water District.

Q. And what's your current occupation or title?

A. My occupation is a hydrologist. My title is principal hydrologist.

Q. Have you ever previously been identified as a witness in an IDWR proceeding?

A. Yes.

Q. About how many proceedings have you been a part of?

A. Probably eight or ten, including both water right matters and some, you know, private district court things that related to water but not before IDWR, and I haven't parsed it out.

Q. For the record, were you invited to participate in what's been referred to as the 2022 technical working group for this matter?

A. I was not.

Q. Okay. So you're coming in fresh and having to review some of this information?
A. Yes.
Q. You had already stated you're here representing Bonneville-Jefferson Ground Water District; correct?
A. Yes.
Q. Were you asked to create an expert report for this proceeding on their behalf?
A. Yes.
Q. Okay. And has that report been provided?
A. Yes.
Q. Will you please turn to Exhibit 500.
Yeah, there should be three copies.
COURT REPORTER: And if you can guys can slow down a little bit, please.
MR. JOHNS: I thought I was going slow. I'll try.
THE WITNESS: We're trying to go slow in an expedited manner.
MR. JOHNS: Being concise in an expedited matter.
Q. (BY MR. JOHNS) Could you please identify the document that's in front of you.
A. It's my expert report. It has a long title,

but it's my report.

Q. Okay. And can you please identify what you were asked to do in this report.

A. So I was asked to do just four things, kind of a subset of all of the issues:

I was asked to look at the technical arguments made by the Department to justify the change to a transient modeling.

I was asked to review the purposes of the ESPAM models and technical opinions regarding the use of those models.

I was asked to talk about the possible application of source water fractions to address the supplemental water question.

And then I was asked to talk about logical consistency in the use of transient modeling and in the use of steady state modeling.

Q. Okay. So did you review the Fifth Methodology Order -- and I believe that is marked as Exhibit 300 -- and then the 2023 As-Applied Order, which I believe that's -- did you review those documents?

A. So I did a cursory review of the entire document, and then I focused on the parts relating just to these issues.

Q. What information did you look at in

preparation for this report?

A. I looked at old documents that I had prepared when I worked at Idaho Water Resources Research Institute. I looked at additional information prepared by others from the IDWR website related to the ESPAM modeling. I looked at some prior orders in this matter. We can look back here. Those are the primary ones that I relied on. I looked at a document that I had prepared in a Rangen proceeding.

Q. And is the information pertaining to those documents provided in your report or cited in your report?

A. It is.

Q. Will you please generally describe the conclusions in your report.

A. So I'd like to just quickly go to -- I think it's page 30.

Q. Okay.

A. So the first two opinions -- and I wish I had numbered these -- were regarding the factual reasons given in the Fifth Order. And my conclusion was that those reasons are not factually correct; and that, therefore, I don't know what the actual reasoning was, and I cannot evaluate the actual reasoning.

The next point, the third conclusion is that

the use of ESPAM modeling is technically defensible when the use of the model is tempered both by the knowledge of the ratio of the relief provided and the burden to generate that relief and the precision of the model for the question being answered.

The next two are the response to the question about supplemental groundwater, and it's, essentially, the same thing. The argument's presented in the order I found not to be factually correct, and so I can't speak to the actual reasoning for that decision.

And then the last three talk about the -- well, let's see -- no, the next one talks about the effect. I talk about the multiplier effect of the consequence of ignoring the supplemental use.

The last two, then, talk about the consistency between the time frame of the modeling, the question being asked, and essentially there's two conclusions. One is that if you calculate the obligation one way and partition it another, then you could -- it can result in a party being responsible for more mitigation than their curtailment could have possibly generated.

And then the last one I think is probably the most important, is that technical methods exist to make a technically coherent alignment between the problem that's trying to be solved and the tools that are

available to address the problem.

Q. And the reasons justifying those conclusions are provided in your report; correct?

A. They are. And -- yes.

Q. And you and I had spoke earlier. Have you identified any mistakes or corrections that we need to make on the record that you located in your report after it was submitted?

A. Yeah. I -- the most important one is on page 29, I think. I refer to a figure -- the second full paragraph on page 29 -- "visual inspection of figure R16," I did not get that figure into the report, but it is presented as Exhibit 511. And I'm sure there are some typos that I've not yet captured.

Q. Okay. Just in general, were you able to perform all the work that you wanted to perform in this report?

A. No.

Q. Can you identify just some general technical subject matters that you would have liked to have gotten into?

A. Well, certainly, I would have liked to have reviewed the things that Mr. Sullivan and Ms. Sigstedt reviewed that I didn't even address. But within the topics that were assigned to me, I would like to have

further explored the implications of transient modeling of ESPAM2.2 in regard to this question of assigning responsibility and in regard to the question of the logical consistency between transient and steady state.

I tried to do some exploration for the second purpose, which was to generate a technical opinion regarding the use of the model. I would have liked to have further explored work that's been done by others and some original work regarding anticipated precision and uncertainty of the ESPAM2.2 model.

Q. And was that work not performed due to time constraints?

A. That's correct.

Q. Would it have improved your analysis in reviewing the Fifth Amended Methodology Order and preparing for this hearing?

A. It certainly would have made me -- made my analysis more solid, more coherent, given me more opportunity to be sure that I had not missed something in the analysis. It may also have enabled me to generate additional insights that might have been useful.

Q. I want to talk briefly about your involvement with the ESPAM modeling and your experience at IWRRI.

Can you please describe what work you

performed related to ESPAM while you worked at IWRRI?

A. So while I was at IWRRI, my assignment and the reason I was hired was to be responsible for the water budget input to the model, and so that is all of the -- we call them "goes ins" and "goes outs," all the sources of water and all of the sources of withdrawals from the aquifer with the exception of the interaction of the Snake River.

While I was there, I also generated scenarios using the model after it was -- after the model was developed, first, to the ESPAM1.1 and 1.1 and then to some extent with the ESPAM2.0 model.

The other thing that I did was I ended up having a substantial role in providing transparency through presentations to the Eastern Snake Hydrologic Modeling Committee and in writing design documents.

Q. And did you make presentations to the Department regarding the ESPAM model?

A. I did to the extent that the Department personnel were involved in the ESHMC modeling committee.

Q. And was a report generated for that or some sort of a document generated?

A. So there were many documents. I think the one that I referred to in this report was a specific report. IWRRI was asked, and I was tasked to be the lead on

assessing what would be the implications of using the ESPAM model, and this was initially the ESPAM1.0 model, in assessing the effects of curtailment of groundwater rights.

Q. Did your analysis include an analysis of transient modeling?

A. It did.

Q. And to your knowledge, has that information changed over time, at least the findings with regard to transient modeling?

A. So qualitatively, nothing has changed. And a good part of my report wades through individual findings that were in that 2006 document. But -- you know, but the nutshell is, there's nothing known now about transient modeling that was not known then. Different versions of the model produced different results, and so those have changed, but qualitatively, nothing has changed.

Q. And you've been present -- just for the record -- you've been present this -- since Tuesday when this hearing began and listened to the testimony that's been presented by the witnesses?

A. Yes. You know, I've stepped out a time or two, but I've been here the whole time.

Q. And so I think that this -- I want -- again, I

want to be concise. I think that some of the arguments on this have already been presented, but do you agree with the statement that the technical justifications for moving from -- or do you agree with the Department's technical justifications for IDWR moving from steady state to transient as they're presented in the Fifth Methodology Order?

A. I do not.

Q. And do you agree that with -- I believe it was with Ms. Sukow -- I don't want to mischaracterize her testimony, but I think she said that the decision was not technical to move from the steady state or to transient; is that correct? Or is that your recollection of her testimony?

A. That sounds about like what she said. So if there were technical reasons, number one, they have not been revealed, to my knowledge; and number two, I can't think of any technical reasons.

Q. Well, I won't belabor that point, but have the reasons -- or have your reasons for your conclusion with regard to the technical justifications for transient been provided in your report?

A. Yes.

Q. Okay. Is there anything else that you'd like to add on the technical justifications for transient?

A. I think just qualitatively that either steady state or transient could be, technically, justifiable if the entire package were considered, if all the implications of either type of modeling were considered.

Q. And I think we're going to talk about a couple of those. We'll dig into them. So we'll move on to -- let's grab -- I think it's Exhibit -- the Fifth Methodology Order, is that Exhibit --

MR. WOOD: 300.

MR. JOHNS: 300?

MR. WOOD: Yeah.

MR. JOHNS: If we could grab a copy of that.

THE WITNESS: Here we go.

MR. WOOD: Did you find it?

THE WITNESS: I did. At least it has the right number on the cover. Okay, yes.

Q. (BY MR. JOHNS) Could you turn to page 30 of the Fifth Methodology Order.

A. Page 30?

Q. Yeah. And could you read Finding of Fact 83, please.

A. "Merriam-Webster's Dictionary defines steady-state as, 'a state or condition of a system or process that does not change in time.'" And then there's a citation.

"A steady-state ESPAM simulation can only model increases in aquifer discharge to the Snake River resulting from continuous curtailments of an identical magnitude and location until the impacts of curtailment are fully realized. For example, a steady-state analysis of the curtailment of 1,000 acres, assumes that irrigation of the same 1,000 acres is curtailed every year at the same rate of consumptive use until the impacts of that curtailment reach a steady state or no longer change from year to year."

Q. What's your professional reaction to Finding of Fact 83?

A. It's twofold. First, there's some embarrassment that I may have precipitated this line of thinking in my 2006 report. And then second, it's not technically correct.

Q. How so?

A. So steady state can be used to describe a cubic-feet-per-second effect, or it can be used to describe an acre-foot effect. And in the 2006 report, I did use steady state on a cfs basis, and there are ways of construing that that would make this statement true in that context. But in the context of a curtailment, it's an acre-foot basis.

And I think, if you were to -- you know, so

1,000 acres, so that's 2,000 acre-feet per year. If you curtail 2,000 acre-feet per year for an infinite period of time, the accrual to the Snake River would be infinite, and that's not what a steady state model would show you. A steady state model would show you that if you curtailed 2,000 acre-feet, it would show you that 2,000 acre-feet were expressed at various points on the river, and it would estimate where those points were.

Q. What would you include in the definition to make it more accurate?

A. So may I refer back to Exhibit 500?

Q. Yes.

A. Towards the end, I edited it. And if you find the page before I do --

Q. I believe page 12, page 12, Exhibit 500.

A. Are you ready for me?

Q. Let the --

A. Yeah.

Q. -- folks get there.

Go ahead.

A. So I won't read all of this struck material; I'll only read what I retained and what I added.

"Merriam-Webster's Dictionary defines steady-state as 'a state or condition of a system or process that does not change in time.'" And then some

citations.

"A steady-state ESPAM simulation based on input values of acre-feet of curtailment can only indicate total acre-feet of accrual to modeled reaches of the Snake River and tributary springs resulting after the effects of curtailment have been fully realized.

"For example, a steady-state analysis of the curtailment of 1,000 acre-feet would indicate where the 1,000 acre-feet of accrual eventually would be expressed but would not describe the timing of arrival of accruals."

Q. So in your opinion, the definition of steady state, as it appears in the Fifth Methodology, is technically incorrect?

A. As applied to acre-feet, it is technically incorrect.

Q. Can you please turn to page 11 of your report. And I'm looking at Figure R7.

Do you see that?

A. Yes.

Q. Can you explain what Figure R7 shows?

A. Figure R7 is from that 2006 product that we produced for IDWR, and each line represents the transient effects of an ongoing curtailment activity corresponding to the priority date there in the legend.

And the little symbols that are there on the very right represent the equivalent steady state result from that same curtailment date. And what it shows is that over time, the transient modeling does approach the steady state result.

And this figure doesn't show it, but the fact is that if you could run transient out to eternity, then it would exactly equal the steady state result.

Q. So could you explain how transient and steady state are being used in the Methodology Order?

A. So the order itself, as I read it, specifies that transient will be used to determine a priority cutoff date. I didn't find it. And again, I was time-constrained. I didn't find in the Methodology Order a specification of how steady state would be used, but in the As-Applied, I found that it was used to assign responsibility specifically between the parties that have mitigation plans and those who do not.

Q. What about steady state?

A. So I'm sorry, if I misspoke, in the As-Applied, that's how steady state was used.

Q. Okay. And transient is for calculating the priority date?

A. So in the Fifth Order and then the As-Applied, transient was used to calculate the priority date, and

then steady state was used to assign responsibility, as I read those.

Q. Responsibility for mitigation?

A. I believe that was -- yes, I believe it was responsibility for mitigation.

Q. In your opinion, are the different uses of steady state and transient in the Fifth Methodology Order technically defensible?

A. They aren't, both because in neither case is the entire picture considered, but also because they fundamentally speak to different goals or processes. So the transient, you know, just by the nature of it, would be an appropriate tool if you were considering short-term effects. Transient -- or steady state, by the nature of it, would be appropriate if you're trying to consider long-term cumulative effects.

It appears that the Fifth Methodology Order is focused on short-term effects, and, yet, the As Applied still used a tool more appropriate for long-term effects. And, you know, either the goal is this or it's this, and they're not the same thing.

Q. In your review of the Fifth Methodology Order, were you able to identify any of the stated goals for steady state or transient?

A. So there was discussion of a goal of transient

to try to achieve in-season. I think there was -- within the season of use there was a five-month period that was the stated goal for transient. I did not find reference to the prior goal for use of steady state.

Q. So is it your opinion that there's kind of conflicting goals that are going on by the way steady state is being used and transient is being used in the Fifth Methodology Order?

A. So in the order itself, only transient is specified. The As-Applied creates the tension because the As-Applied uses both.

Q. So is it fair to say, to be technically correct, you would need to use transient to do both or steady state to do both calculations?

A. That's my opinion, yes.

Q. And that's not how it's being done this year?

A. That's correct.

Q. What's your understanding of the original purpose of the ESPAM tool?

A. So it was originally designed to aid IDWR both in planning and in administrative questions. Although, I think the word used in most of the reports was "management." I think, from having been there, the intent really was administration, even though the word used was "management."

Q. Has that purpose changed over time?
A. Not to my understanding.
I think the tool has been -- when I was debating whether to go work on the tool, an attorney said, "Don't worry. As soon as an appropriate misuse is identified, it will be misused."
But I think that the primary purposes are still the same, to inform planning and also to inform administration.
Q. Okay. In your report you refer to some -- I believe you referred to them as "precautions," where you identified precautions or factors that need to be considered when using the ESPAM when calculating surface water shortfalls.
Could you summarize what some of those precautions or factors may be and why?
A. Yeah. So the question, when you ask is this the best tool or is this an appropriate tool, you have to consider the suitability of the tool for its purpose. And, you know, if all I have in my toolbox is a crescent wrench, that may be the best tool I have, but it's still not useful for all purposes. For instance, it's not good for turning a Phillips-head screw.
So there are two different ways that I approach this question of the appropriateness of using

the model. And one is twice during my tenure within the ESHMC, the Eastern Snake Hydrologic Modeling Committee, the committee has been asked to provide a statement on appropriate uses of the model. Neither time were we able to come to consensus.

The first time we assembled what we called a white paper, which was really an anthology of statements from various members. The second time various members prepared statements, but the anthology wasn't even assembled. And in that process, there were divergent views, but they ranged from use of the ESPAM model for administration is technically indefensible to it can be used and described some narrow circumstances.
